Chapter 1: Introduction

Introduction to your Router

Welcome to the VoIP Broadband Firewall Router. The router is an “all-in-one” VoIP Broadband router, combining a Broadband router, Ethernet network switch and 2 ports for Voice over IP functionalities, providing everything you need to get the machines on your network connected to the Internet over your DSL/Cable broadband connection. With features such as a Quick-Start wizard and DHCP Server, you can be online in no time at all and with a minimum of fuss and configuration, catering for first-time users to the guru requiring advanced features and control over their Internet connection and network.

Features

- **Voice over IP compliance with SIP standard**

The router supports cost-effective, toll-quality voice calls over the Internet. It complies with the most popular industrial standard, SIP protocol, to ensure the interoperability with SIP devices and major VoIP Gateways. The VoIP router supports call waiting, silence suppression, voice activity detection (VAD), comfort noise generation (CNG), line echo cancellation, caller ID (Bell 202, V3) and so on.
- **Fixed-Line Support**

The router integrates RJ-11 FXO port for inbound and outbound calls transmitted through PSTN. Users can receive phone calls from PSTN while enjoying VoIP call service at the same time. In addition, the device automatically fallbacks to lifeline POTS to enable making normal phone calls when there is power outage, or when the Internet connection is down.
- **802.11g Wireless AP with WPA Support**

With integrated 802.11g Wireless Access Point in the router, the device offers a quick and easy access among wired network, wireless network and broadband connection (ADSL) with single device simplicity, and as a result, mobility to the users. In addition to 54 Mbps 802.11g data rate, it also interoperates backward with existing 802.11b equipment. The Wireless Protected Access (WPA1 and WPA2) and Wireless Encryption Protocol (WEP) supported features enhance the security level of data protection and access control via Wireless LAN.
- **Fast Ethernet Switch**

A 4-port 10/100Mbps fast Ethernet switch is built in with automatic switching between MDI and MDI-X for 10Base-T and 100Base-TX ports. An Ethernet straight or crossover cable can be used directly for auto detection.
- **Multi-Protocol to establish a connection**

It supports PPP over Ethernet (RFC 2516), DHCP (Obtain an IP Address Automatically), and Static IP (Fixed IP Address) to establish a connection with the ISP. The product also supports VC-based and LLC-based multiplexing.
- **Quick Installation Wizard**

It supports a WEB GUI page to install this device quickly. With this wizard, end users can enter the information easily which they get from their ISP, then surf the Internet immediately.
- **Universal Plug and Play (UPnP) and UPnP NAT Traversal**

This protocol is used to enable simple and robust connectivity among stand-alone devices and PCs from many different vendors. It makes network simple and affordable for users. UPnP architecture leverages TCP/IP and the Web to enable seamless proximity networking in addition to control and data transfer among networked devices. With this feature enabled, users can now connect to Net meeting or MSN Messenger seamlessly.

- **Network Address Translation (NAT)**

Allows multi-users to access outside resources such as the Internet simultaneously with one IP address/one Internet access account. Many application layer gateway (ALG) are supported such as web browser, ICQ, FTP, Telnet, E-mail, News, Net2phone, Ping, NetMeeting, IP phone and others.
- **SOHO Firewall Security with DoS and SPI**

Along with the built-in NAT natural firewall feature, the router also provides advanced hacker pattern-filtering protection. It can automatically detect and block Denial of Service (DoS) attacks. The router is built with Stateful Packet Inspection (SPI) to determine if a data packet is allowed through the firewall to the private LAN.
- **Domain Name System (DNS) relay**

It provides an easy way to map the domain name (a friendly name for users such as www.yahoo.com) and IP address. When a local machine sets its DNS server with this router's IP address, every DNS conversion request packet from the PC to this router will be forwarded to the real DNS in the outside network.
- **Dynamic Domain Name System (DDNS)**

The Dynamic DNS service allows you to alias a dynamic IP address to a static hostname. This dynamic IP address is the WAN IP address. For example, to use the service, you must first apply for an account from a DDNS service like <http://www.dyndns.org/>. More than 5 DDNS servers are supported.
- **Quality of Service (QoS)**

QoS gives you full control over which types of outgoing data traffic should be given priority by the router, ensuring important data like gaming packets, customer information, or management information move through the router at lightning speed, even under heavy load. The QoS features are configurable by source IP address, destination IP address, protocol, and port. You can throttle the speed at which different types of outgoing data pass through the router, to ensure P2P users don't saturate upload bandwidth, or office browsing doesn't bring client web serving to a halt. In addition, or alternatively, you can simply change the priority of different types of upload data and let the router sort out the actual speeds.
- **Virtual Server ("port forwarding")**

Users can specify some services to be visible from outside users. The router can detect incoming service requests and forward either a single port or a range of ports to the specific local computer to handle it. For example, a user can assign a PC in the LAN acting as a WEB server inside and expose it to the outside network. Outside users can browse inside web servers directly while it is protected by NAT. A DMZ host setting is also provided to a local computer exposed to the outside network, Internet.
- **Rich Packet Filtering**

Not only filters the packet based on IP address, but also based on Port numbers. It will filter packets from and to the Internet, and also provides a higher level of security control.
- **Dynamic Host Configuration Protocol (DHCP) client and server**

In the WAN site, the DHCP client can get an IP address from the Internet Service Provider (ISP) automatically. In the LAN site, the DHCP server can allocate a range of client IP addresses and distribute them including IP address, subnet mask as well as DNS IP address to local computers. It provides an easy way to manage the local IP network.
- **Static and RIP1/2 Routing**

It has routing capability and supports easy static routing table or RIP1/2 routing protocol.
- **Simple Network Management Protocol (SNMP)**

It is an easy way to remotely manage the router via SNMP.
- **Web based GUI**

It supports web based GUI for configuration and management. It is user-friendly and comes with on-line help. It also supports remote management capability for remote users to configure and manage this product.

- **Firmware Upgradeable**

Device can be upgraded to the latest firmware through the WEB based GUI.

- **Rich Management Interfaces**

It supports flexible management interfaces with local console port, LAN port, and WAN port. Users can use terminal applications through the console port to configure and manage the device, or Telnet, WEB GUI, and SNMP through LAN or WAN ports to configure and manage the device.

Chapter 2: Installing the Router

Important note for using this router

Warning

- ✓ Do not use this router in high humidity or high temperatures.
- ✓ Do not use the same power source for this router as other equipment.
- ✓ Do not open or repair the case yourself. If this router is too hot, turn off the power immediately and have it repaired at a qualified service center.
- ✓ Avoid using this product and all accessories outdoors.

Attention

- ✓ Place this router on a stable surface.
- ✓ Only use the power adaptor that comes with the package. Using a different voltage rating power adaptor may damage this router.

Package Contents

- VoIP / (802.11g) Broadband Firewall Router
- CD-ROM containing the online manual
- Ethernet (CAT-5 LAN) Cable
- Console tool
- AC-DC power adaptor (BiPAC 6404VP - 12V DC, 1A) (BiPAC 6404VGP - 12V DC, 1.2A)
- Quick Start Guide

The Front LEDs

LED		Meaning
1	PWR	Lit when power is ON.
2	SYS	Lit when the system is ready.
3	WAN	Lit when connected to an ADSL modem or Cable modem's Ethernet port well
4 – 6	LAN Port 1X — 3X (RJ-45 connector)	Lit when connected to an Ethernet device. Green for 100Mbps; Orange for 10Mbps. Blinking when data is Transmitted / Received.
7	WLAN (Wireless Router Only)	Lit green when the wireless connection is established. Flashes when sending/receiving data.
8 – 9	Phone 1X — 2X (RJ-11 connector)	Lit green when the phone is off-hook.
10	LINE	Lit when the inbound and outbound calls transmitted through PSTN.
12	VoIP Port 1X — 2X (RJ-11 connector)	Lit when the SIP Registration is OK. Green for Phone 1; Orange for Phone 2.
13	PPP	Lit Green when there is a PPPoE connection.

The Rear Ports

NOTE:
✍

The Ethernet Port # 3 can be used as a console port. You need a special console tool which already includes in the package to connect with LAN port 3 and PC's RS-232 port (9-pin serial port).

Port		Meaning
1	Power Switch	Power ON/OFF switch
2	PWR	Connect the supplied power adapter to this jack.
3	RESET	To be sure the device is being turned on → press RESET button for: 1-3 seconds: quick reset the device. 6 seconds above, and power off, power on the device: restore to factory default settings. (Cannot login to the router or forgot your Username/Password. Press the button for more than 6 seconds). Caution: After pressing the RESET button for more than 6 seconds, to be sure you power cycle the device again.
4	WAN	WAN 10/100M Ethernet port (with auto crossover support); connect xDSL/Cable modem here.
5	LAN 1X — 3X (RJ-45 connector)	Connect a UTP Ethernet cable (Cat-5 or Cat-5e) to one of the LAN ports when connecting to a PC or an office/home network of 10Mbps or 100Mbps. Caution: Port 3 can be either a LAN or Console port at a time but not both.
5	Console Port (LAN port 3) (RJ-45 connector)	Connect a UTP Ethernet cable (Cat-5 or Cat-5e) to one of the LAN ports when connecting to a PC or an office/home network of 10Mbps or 100Mbps. Caution: Port 3 can be either a LAN or Console port at a time but not both.
6	Phone 1X — 2X (RJ-11 connector)	Connect RJ-11 cable to this port when connecting to an analog phone set.

7	LINE	Connect RJ-11 cable to this port when connecting to the telephone wall jack.
---	-------------	--

Cabling

The most common problem associated with Ethernet is bad cabling. Make sure that all connected devices are turned on. On the top of the product is a bank of LEDs, as a first check, verifies that the relevant LAN Link and WAN Link LEDs are lit. If they are not, verify that you are using the proper cables.

Chapter 3: Basic Installation

The router can be configured with your web browser. A web browser is included as a standard application in the following operating systems: Linux, Mac OS, Windows 98/NT/2000/XP/Me, etc. The product provides an easy and user-friendly interface for configuration.

Please check your PC's network components. The TCP/IP protocol stack and Ethernet network adapter must be installed. If not, please refer to your Windows-related or other operating system manuals.

There are ways to connect with the router, either through an external repeater hub to the router or directly connecting with PCs. However, to be sure PCs have an Ethernet interface installed properly prior to connecting to the router device. You ought to configure your PCs to obtain an IP address through a DHCP server or a fixed IP address that must be in the same subnet as the router. The default IP address of the router is **192.168.1.254** and the subnet mask is **255.255.255.0** (i.e. any attached PC must be in the same subnet, and have an IP address in the range of 192.168.1.1 to 192.168.1.253). The best and easiest way is to configure the PC to get an IP address automatically from the router using DHCP. If you encounter any problem accessing the router's web interface it may also be advisable to **uninstall** any kind of software firewall on your PCs, as they can cause problems accessing the 192.168.1.254 IP address of the router. Users should make their own decisions on how to best protect their network.

Please follow the steps below for your PC's network environment installation.

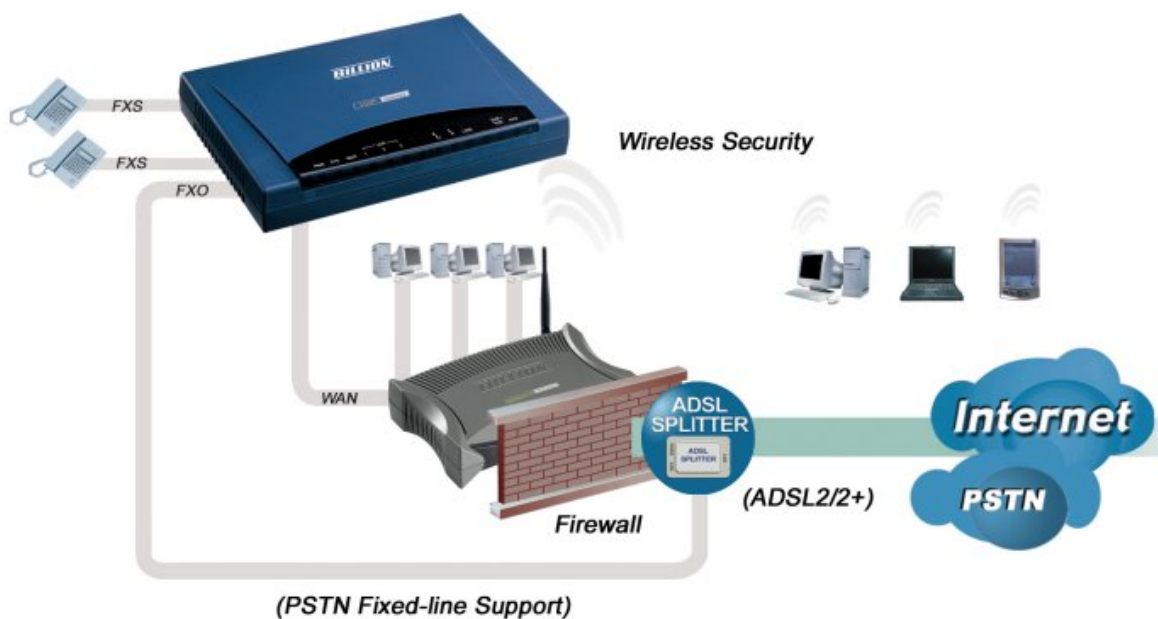

Any TCP/IP capable workstation can be used to communicate with or through the router. To configure other types of workstations, please consult the manufacturer's documentation.

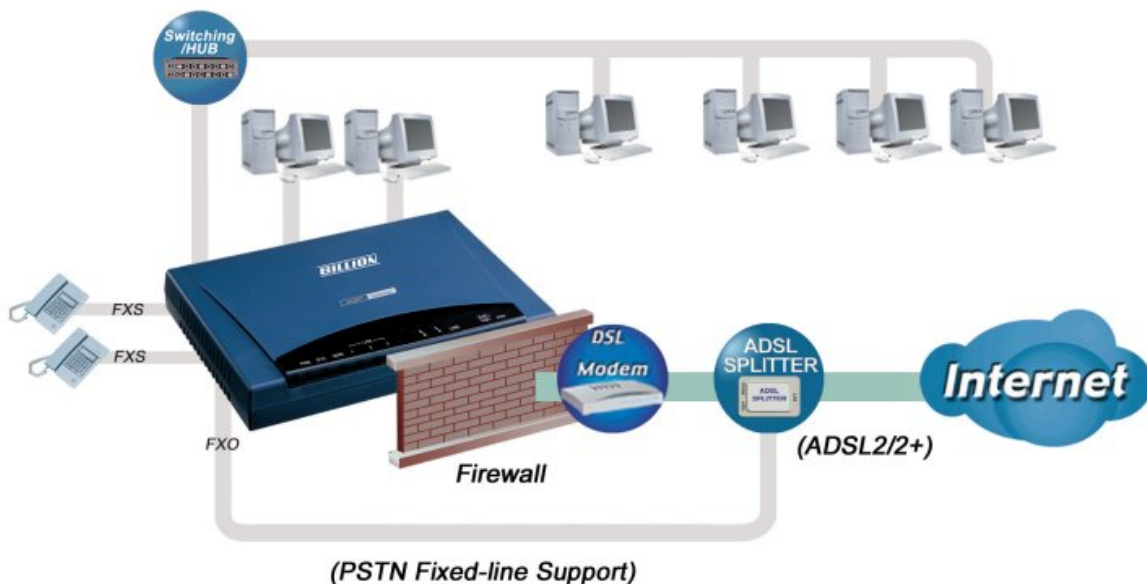

Connecting Your Router

- ATA Mode:** Connect the ATA to a **WAN** (Connect to ADSL modem/router).
 - Broadband Router Mode:** Connect the Router to a **LAN** (Local Area Network) and **WAN** (Connect to Cable or ADSL modem).
- Power on the device.
- Make sure the **PWR** and **SYS** LEDs are lit steadily and that the **WAN** and relevant **LAN** LED are lit.
- Connect an RJ11 cable to VoIP port when connecting to an analog phone set.
- Connect RJ-11 cable to LINE Port when connecting to the telephone wall jack.

ATA Mode

Broadband Router Mode

Configuring PCs in Windows in Window XP

1. Go to **Start / Control Panel** (in Classic View). In the Control Panel, double-click **Network Connections**.
2. Double-click **Local Area Connection**. (See Figure 3.1)

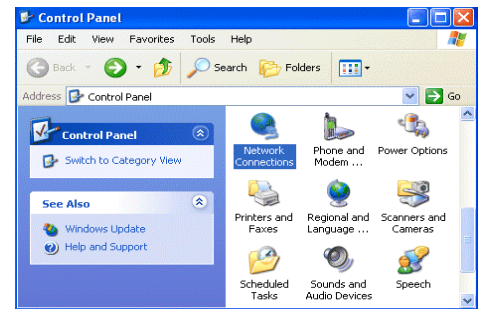

Figure 3.1: LAN Area Connection

3. In the **LAN Area Connection Status** window, click **Properties**. (See Figure 3.2)

Figure 3.2: LAN Connection Status

4. Select **Internet Protocol (TCP/IP)** and click **Properties**. (See Figure 3.3)

Figure 3.3: TCP / IP

5. Select the **Obtain an IP address automatically** and **Obtain DNS server address automatically** radio buttons. (See Figure 3.4)
6. Click **OK** to finish the configuration.

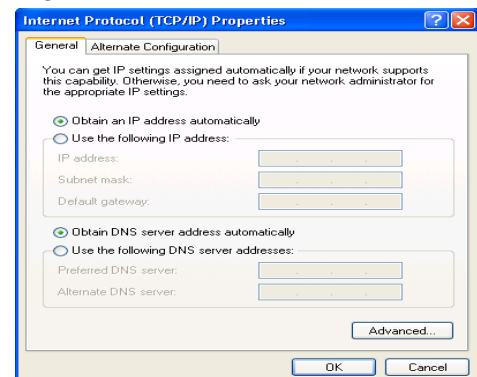

Figure 3.4: IP Address & DNS Configuration

Configuring PCs in Windows 2000

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click **Network and Dial-up Connections**.
2. Double-click **Local Area ("LAN") Connection**. (See Figure 3.5)

Figure 3.5: LAN Area Connection

3. In the **LAN Area Connection Status** window, click **Properties**. (See Figure 3.6)

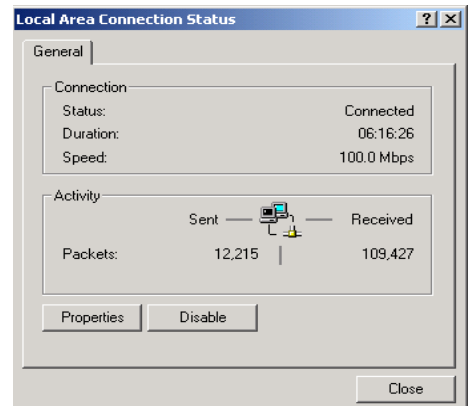

Figure 3.6: LAN Connection Status

4. Select **Internet Protocol (TCP/IP)** and click **Properties**. (See Figure 3.7)

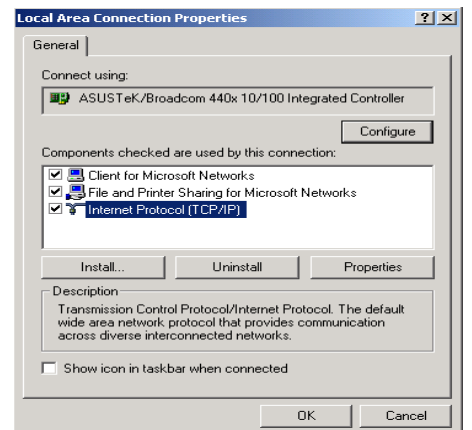

Figure 3.7: TCP / IP

5. Select the **Obtain an IP address automatically** and **Obtain DNS server address automatically** radio buttons. (See Figure 3.8)
6. Click **OK** to finish the configuration.

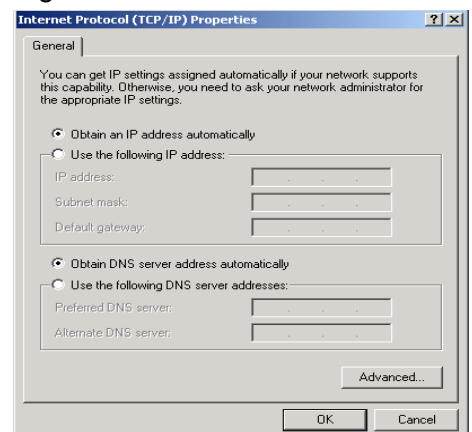

Figure 3.8: IP Address & DNS Configuration

Configuring PC in Windows 95/98/ME

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click **Network** and choose the **Configuration** tab.
2. Select **TCP / IP -> NE2000 Compatible**, or the name of any Network Interface Card (NIC) in your PC. (See Figure 3.9)
3. Click **Properties**.

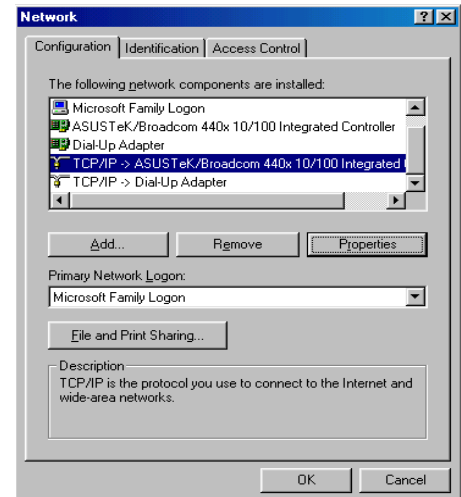

Figure 3.9: TCP / IP

4. Select the **IP Address** tab. In this page, click the Obtain an IP address automatically radio button. (See Figure 3.10)

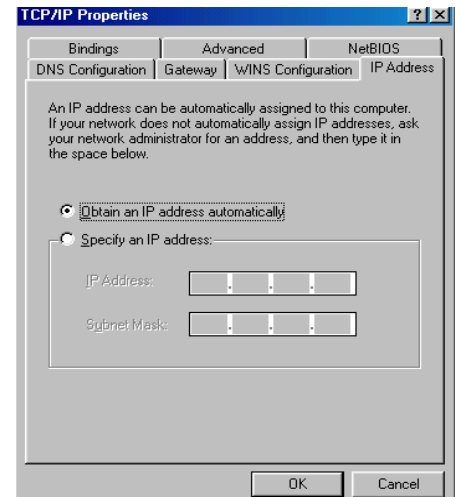

Figure 3.10: IP Address

5. Then select the **DNS Configuration** tab. (See Figure 3.11)
6. Select the **Disable DNS** radio button and click **OK** to finish the configuration.

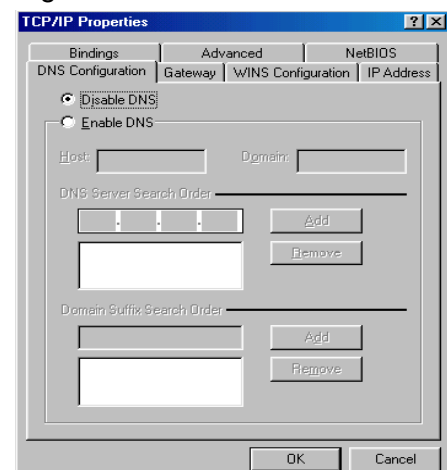

Figure 3.11: DNS Configuration

Configuring PC in Windows NT4.0

1. Go to **Start / Settings / Control Panel**. In the Control Panel, double-click **Network** and choose the **Protocols** tab.
2. Select **TCP/IP Protocol** and click **Properties**. (See Figure 3.12)

Figure 3.12: TCP / IP

3. Select the **Obtain an IP address from a DHCP server** radio button and click **OK**. (See Figure 3.13)

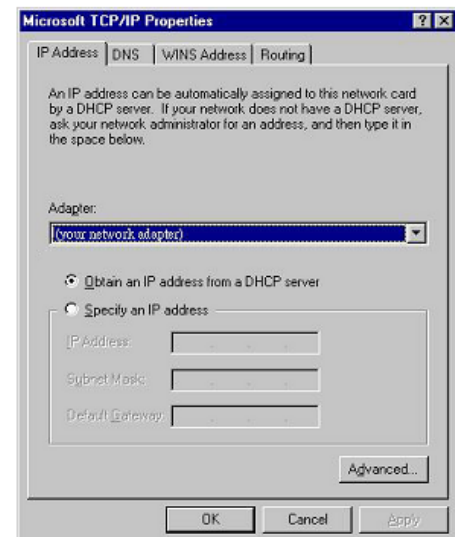

Figure 3.13: IP Address

Factory Default Settings

Before configuring your, you need to know the following default settings.

Web Interface (Username and Password)

- ▶ Username: admin
- ▶ Password: admin

The default username and password are “**admin**” and “**admin**” respectively.

Attention

If you ever forget the username/password to login to the router, you may press the RESET button up to 6 seconds to restore the factory default settings.

Caution: After pressing the RESET button for more than 6 seconds, to be sure you power cycle the device again.

Device LAN IP settings:

- ▶ IP Address: 192.168.1.254
- ▶ Subnet Mask: 255.255.255.0

ISP setting in WAN site:

- ▶ PPPoE

DHCP server

- ▶ DHCP server is enabled.
- ▶ Start IP Address: 192.168.1.100
- ▶ IP pool counts: 100

LAN and WAN Port Addresses

The parameters of LAN and WAN ports are pre-set in the factory. The default values are shown below.

LAN Port		WAN Port
IP address	192.168.1.254	The PPPoE function is <i>enabled</i> to automatically get the WAN port configuration from the ISP.
Subnet Mask	255.255.255.0	
DHCP server function	Enabled	
IP addresses for distribution to PCs	100 IP addresses continuing from 192.168.1.100 through 192.168.1.199	

Information from your ISP

Before configuring this device, you have to check with your ISP (Internet Service Provider) to find out what kind of service is provided such as DHCP (Obtain an IP Address Automatically, Static IP (Fixed IP Address) and PPPoE.

Gather the information as illustrated in the following table and keep it for reference.

<p>DHCP (Obtain an IP Address Automatically)</p>	<p>Configure this WAN Interface to use DHCP client protocol to get an IP address from your ISP automatically. Your ISP provides an IP address to the router dynamically when logging in.</p>
<p>Static IP (Fixed IP Address)</p>	<p>Configure this WAN interface with a specific IP address. This IP address should be provided by your ISP.</p>
<p>PPPoE</p>	<p>PPPoE (PPP over Ethernet) is known as a dial-up DSL or cable service. It is designed to integrate the broadband services into the current widely deployed, easy-to-use, and low-cost dial-up-access networking infrastructure.</p>

Configuring with your Web Browser

Open your web browser, enter the IP address of your router, which by default is **192.168.1.254**, and click **Go**, a user name and password window prompt will appear. **The default username and password are “admin” and “admin” respectively. (See Figure 3.14)**

Figure 3.14: User name & Password Prompt Window

Congratulation! You are now successfully logon to the VoIP/(802.11g) Broadband Router!

Chapter 4: Configuration

At the configuration homepage, the left navigation pane where bookmarks are provided links you directly to the desired setup page, including:

- **Status**
 - [ARP Table](#)
 - [Wireless Association Table](#) (Wireless Router Only)
 - [Routing Table](#)
 - [DHCP Table](#)
 - [Email Status](#)
 - [VoIP Status](#)
 - [Event Log](#)
 - [Error Log](#)
 - [NAT Sessions](#)
 - [Diagnostic](#)
 - [UPnP Portmap](#)
- **ATA / Router Mode**
- **Configuration**
 - [LAN](#)
 - [System](#)
 - [Firewall](#)
 - [VoIP](#)
 - [QoS](#)
 - [Virtual Server](#)
 - [Time Schedule](#)
 - [Advanced](#)
- **Save Config to FLASH**
- **Language** (provides user interface in English and French languages).
- **Logout**

Please click the links to see the relevant sections of this manual for detailed instructions on how to configure the VoIP/(802.11g) Broadband Router.

Status

ARP Table

This section displays the router's ARP (Address Resolution Protocol) Table, which shows the mapping of Internet (IP) addresses to Ethernet (MAC) addresses. This is useful as a quick way of determining the MAC address of the network interface of your PCs to use with the router's **Firewall – MAC Address Filter** function. See the Firewall section of this manual for more information on this feature.

ARP Table

IP <> MAC List

IP Address	MAC Address	Interface	Static
192.168.1.187	00:0c:6e:bd:11:6d	iplan	no

IP Address: A list of IP addresses of devices on your LAN (Local Area Network).

MAC Address: The MAC (Media Access Control) addresses for each device on your LAN.

Interface: The interface name (on the router) that this IP Address connects to.

Static: Static status of the ARP table entry:

- ⊙ “no” for dynamically-generated ARP table entries
- ⊙ “yes” for static ARP table entries added by the user

Wireless Association Table (Wireless Router Only)

Wireless Association Table

Wireless client's MAC address and the corresponding IP address

IP Address	MAC
192.168.1.100	00:04:23:73:9a:86

IP Address: It is IP address of wireless client that joins this network.

MAC: the MAC address of wireless client.

Routing Table

Routing Table

Routing Table

Valid	Destination	Netmask	Gateway/Interface	Cost
✓	0.0.0.0	0.0.0.0	192.168.21.1	1

RIP Routing Table

Destination	Netmask	Gateway	Cost
-------------	---------	---------	------

Routing Table

Valid: It indicates a successful routing status.

Destination: The IP address of the destination network.

Netmask: The destination netmask address.

Gateway/Interface: The IP address of the gateway or existing interface that this route will use.

Cost: The number of hops counted as the cost of the route.

RIP Routing Table

Destination: The IP address of the destination network.

Netmask: The destination netmask address.

Gateway: The IP address of the gateway that this route will use.

Cost: The number of hops counted as the cost of the route.

DHCP Table

DHCP Table		
Type		
Leased ▶	Expired ▶	Permanent ▶

Leased: The DHCP assigned IP addresses information.

IP Address: A list of IP addresses of devices on your LAN (Local Area Network).

Expired: The expired IP addresses information.

Permanent: The fixed host mapping information

Leased Table

Leased Table			
IP Address	MAC Address	Client Host Name	Expiry

IP Address: The IP address that assigned to client.

MAC Address: The MAC address of client.

Client Host Name: The Host Name (Computer Name) of client.

Expiry: The current lease time of client.

Expired Table

Expired Table			
IP Address	MAC Address	Client Host Name	Expiry

Please refer the **Leased Table**.

Permanent Table

Permanent Table			
Name	IP Address	MAC Address	Maximum Lease Time

Name: The name you assigned to the Permanent configuration.

IP Address: The fixed IP address for the specify client.

MAC Address: The MAC Address that you want to assign the fixed IP address

Maximum Lease Time: The maximum lease time interval you allow to clients

Email Status

Details and status for the Email Account you have configured the router to check. Please see the **Advanced** section of this manual for details on this function.

Email Status	
Email Account	
Account Name	username
POP3 Mail Server	pop3.mail.com
Email Status	No mail
<input type="button" value="Reset Status"/> <input type="button" value="Check Now"/>	

VoIP Status

Here you can check details and status of VoIP Account you have configured. Please see the **VoIP Configuration** section for more details.

VoIP Status				
Phone Port				
Index	Phone Number	User Domain/Realm	Display Name	Registered
1				unknown
2				unknown
<input type="button" value="Refresh"/>				

Event Log

This page displays the router's Event Log entries. Major events are logged to this window, such as when the router's ADSL connection is disconnected, as well as Firewall events when you have enabled Intrusion or Blocking Logging in the **Configuration – Firewall** section of the interface. Please see the **Firewall** section of this manual for more details on how to enable Firewall logging.

Event Log

```

----- system log buffer head -----
Jan 01 00:00:11 home.gateway:im:none: Changed iplan IP address to 192.168.1.254
Jan 01 22:00:20 home.gateway:im:none: Reset SNMP community to factory default
settings
----- system log buffer tail -----

```

Error Log

Any errors encountered by the router (e.g. invalid names given to entries) are logged to this window.

Error Log

Error Log (*times are in seconds since last reboot*)

When	Process	Error Log
------	---------	-----------

NAT Sessions

This section lists all current NAT sessions between interface of types external (WAN) and internal (LAN).

NAT Sessions

Active NAT sessions between interface of types external and internal:

Prot	Local IP: Port	local/public	Remote IP: Port	Idle (sec.)
TCP	192.168. 1.201: 1110/	1110	64. 94.110. 12: 80	29
TCP	192.168. 1. 99: 1982/	1982	210.184.108.126: 80	729
TCP	192.168. 1. 99: 1979/	1979	207. 68.178.239: 80	542
TCP	192.168. 1.202: 2011/	2011	207. 46.107. 27: 1863	21
TCP	192.168. 1.100: 1166/	1166	207. 46.106. 90: 1863	18
TCP	192.168. 1. 99: 1969/	1969	207. 46.107. 22: 1863	673
ICMP	192.168. 1.201: 512/	512	168. 95. 4.211: 512	0

TCP : 6 sessions
 UDP : 0 sessions
 Others : 1 sessions
 Total : 7 sessions

Refresh

Diagnostic

It tests the connection to computer(s) which is connected to LAN ports and also the WAN Internet connection. If **PING www.google.com** is shown **FAIL** and the rest is **PASS**, you ought to check your PC's DNS settings is set correctly.

Diagnostic

LAN Connection	
Testing Ethernet LAN connection	PASS
WAN Connection	
Testing ADSL Synchronization	FAIL
Testing WAN connection	FAIL
Ping Primary Domain Name Server	FAIL
PING www.google.com	FAIL

Refresh

UPnP Portmap

The section lists all port-mapping established using UPnP (Universal Plug and Play). Please see the **Advanced** section of this manual for more details on UPnP and the router's UPnP configuration options.

UPnP Portmap

UPnP Portmap Table

Name	Protocol	External Port	Redirect Port	IP Address
emwebigd1024	udp	35324 ~ 35324	15852 ~ 15852	192.168.1.205
emwebigd1025	tcp	48888 ~ 48888	14811 ~ 14811	192.168.1.205
emwebigd1063	udp	9210 ~ 9210	15169 ~ 15169	192.168.1.202
emwebigd1064	tcp	50937 ~ 50937	14500 ~ 14500	192.168.1.202

ATA / Router Mode

ATA/Router Mode	
Connection	
Device Type	<input type="radio"/> Analog Terminal Adapter(ATA) <input checked="" type="radio"/> VoIP Router
WAN Type	PPPoE
Optional Settings	
IP Address	<input type="text"/> (0.0.0.0' means 'Obtain an IP address automatically')
Subnet Mask	<input type="text"/>
Default Gateway	<input type="text"/>
DNS	
Obtain DNS automatically	<input checked="" type="checkbox"/> Enable
Primary DNS	<input type="text"/>
Secondary DNS	<input type="text"/>
PPP	
Username	<input type="text"/>
Password	<input type="text"/>
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

You have the option to configure the device to a pure Analog Telephone Adaptor (ATA); doing so, you will lose the access capability to other feature functions such as Firewall, QoS and etc. By default, the device is set to VoIP Router, concurrently, you can enjoy the content functions and at the same making a toll-quality voice calls over the Internet or via a traditional landline.

Usually, the only information you need for the Quick Start Wizard in order to get you online is your login information. Your ISP shall have supplied all the details you need. In additional, you have the option to provide specific DNS as your desire, or check the **Enable** box to get the DNS automatically from your ISP.

Analog Telephone Adaptor (ATA) vs. VoIP Router Functional Comparison Table

Functions	ATA	VoIP Router
LAN	Disabled	Active
NAT	Turn OFF	Turn ON
DHCP Server	Turn OFF	Turn ON
Device IP	0.0.0.0 / 0.0.0.0	192.168.1.254 / 24
WAN	Disabled	Active
System	Disabled	Active
Firewall	Disabled	Active
QoS	Disabled	Active
Virtual Server	Disabled	Active
Time Schedule	Disabled	Active
Advanced	Disabled	Active

Note: For ATA device management. When configuring to ATA mode, to be sure you renew your PC IP to be in the same subnet as your ATA. Fail to do renew your PC IP will block you from accessing the router device. If problem persists, please RESET your router to its factory settings (pushing the RESET more than 6 seconds).

Here is detailed WAN Type description for your reference.

DHCP (Obtain an IP Address Automatically)	Configure this WAN Interface to use DHCP client protocol to get an IP address from your ISP automatically. Your ISP provides an IP address to the router dynamically when logging in.
Static IP (Fixed IP Address)	Configure this WAN interface with a specific IP address. This IP address should be provided by your ISP.
PPPoE	PPPoE (PPP over Ethernet) is known as a dial-up DSL or cable service. It is designed to integrate the broadband services into the current widely deployed, easy-to-use, and low-cost dial-up-access networking infrastructure.

Configuration

When you click this item, you get following sub-items to configure your router.

LAN, System, Firewall, VoIP, QoS, Virtual Server, Time Schedule and Advanced

These functions are described below in the following sections.

LAN (Local Area Network)

Here are the items within LAN section: [Ethernet](#), [IP Alias](#), [Ethernet Client Filter](#), [Wireless](#), [Wireless Security](#), [Wireless Client Filter](#) and [DHCP Server](#).

Ethernet

Ethernet				
Primary IP Address				
IP Address	192	168	1	254
SubNetmask	255	255	255	0
RIP	<input type="checkbox"/> RIP v1 <input type="checkbox"/> RIP v2 <input type="checkbox"/> RIP v2 Multicast			
<input type="button" value="Apply"/>				

Primary IP Address

IP Address: The default IP on this router.

SubNetmask: The default subnet mask on this router.

RIP: RIP v1, RIP v2, and RIP v2 Multicast. Check to enable RIP function.

IP Alias

This function supports to create multiple virtual IP interfaces on this router. It helps to connect two or more local networks to the ISP or remote node. In this case, an internal router is not required.

IP Alias				
Parameters				
IP Address	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
SubNetmask	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>
Security Interface	<input checked="" type="radio"/> Internal <input type="radio"/> External <input type="radio"/> DMZ			
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>				

IP Address: Specify an IP address on this virtual interface.

SubNetmask: Specify a subnet mask on this virtual interface.

Security Interface: Specify the firewall setting on this virtual interface.

Internal: The network is behind NAT. All traffic will do network address translation when sending out to Internet if NAT is enabled.

External: There is no NAT on this IP interface and connected to the Internet directly. Mostly it will be used when providing multiple public IP addresses by ISP. In this case, you can use public IP address in local network which gateway IP address point to the IP address on this interface.

DMZ: Specify this network to DMZ area. There is no NAT on this interface.

Active PC in LAN displays a list of individual Ethernet device's IP Address & MAC Address which connecting to the router.

You can easily by checking the box next to the IP address to be blocked or allowed. Then, **Add** to insert to the Ethernet Client Filter table. The maximum Ethernet client is 16.

Wireless (Wireless Router Only)

Wireless	
Parameters	
WLAN Service	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Mode	802.11b + g <input type="button" value="v"/>
ESSID	wlan-ap <input type="text"/>
ESSID Broadcast	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Regulation Domain	N.America <input type="button" value="v"/>
Channel ID	Channel 1 (2.412 GHz) <input type="button" value="v"/> Scan Channel Usage
Tx PowerLevel	180 <input type="text"/> (0 ~ 255)
Connected	true
AP MAC address	00:13:d3:68:95:34
AP Firmware Version	1.0.6.0
Wireless Distribution System (WDS)	
WDS Service	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Peer WDS MAC address	00:00:00:00:00:00 <input type="text"/>
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

Parameters

WLAN Service: Default setting is set to **Enable**. If you do not have any wireless, both 802.11g and 802.11b, device in your network, select **Disable**.

Mode: The default setting is **802.11b+g** (Mixed mode). If you do not know or have both 11g and 11b devices in your network, then keep the default in **mixed mode**. From the drop-down manual, you can select **802.11g** if you have only 11g card. If you have only 11b card, then select **802.11b**.

ESSID: The ESSID is the unique name of a wireless access point (AP) to be distinguished from another. For security propose, change the default **wlan-ap** to a unique ID name to the AP which is already built-in to the router's wireless interface. It is case sensitive and must not excess 32 characters. Make sure your wireless clients have exactly the ESSID as the device, in order to get connected to your network.

Note: It is case sensitive and must not excess 32 characters.

ESSID Broadcast: It is function in which transmits its ESSID to the air so that when wireless client searches for a network, router can then be discovered and recognized. Default setting is **Enabled**.

Disable: If you do not want broadcast your ESSID. Any client uses "any" wireless setting cannot discover the Access Point (AP) of your router.

Enable: Any client that using the "any" setting can discover the Access Point (AP) in

Regulation Domain: There are seven Regulation Domains for you to choose from, including North America (N.America), Europe, France, etc. The Channel ID will be different based on this setting.

Channel ID: Select the wireless connection ID channel that you would like to use. Use the *Scan Channel Usage* to help to select non-occupied wireless channel.

Scan Channel Usage: Wireless channel scan takes up to 14 seconds to survey the channel ID in the network area. The result will show all ID channel is being occupied or not occupied.

Note: Wireless performance may degrade if select ID channel is already being occupied by other AP(s).

TX PowerLevel: It is function that enhances the wireless transmitting signal strength. User may

adjust this power level from minimum 0 up to maximum 255.

Note: The Power Level maybe different in each access network user premises environment and choose the most suitable level for your network.

Connected: Representing in **true** or **false**. That it is the connection status between the system and the build-in wireless card.

AP MAC Address: It is a unique hardware address of the Access Point.

AP Firmware Version: The Access Point firmware version.

Wireless Distribution System (WDS)

It is a wireless access point mode that enables wireless link and communication with other access point. It is easy to be installed simply define peer's MAC address of the connected AP. WDS takes advantages of cost saving and flexibility which no extra wireless client device is required to bridge between two access points and extending an existing wired or wireless infrastructure network to create a larger network.

In addition, WDS enhances its link connection security in WEP mode, WEP key encryption must be the same for both access points.

WDS Service: The default setting is **Disabled**. Check **Enable** radio button to activate this function.

Peer WDS MAC Address: It is the associated AP's MAC Address. It is important that your peer's AP must include your MAC address in order to acknowledge and communicate with each other.

Note: For MAC Address, Semicolon (:) must be included.

Wireless Security (Wireless Router Only)

You can disable or enable with WPA or WEP for protecting wireless network. The default mode of wireless security is **disabled**.

Wireless Security	
Parameters	
Security Mode	Disable <input type="button" value="v"/>
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

WPA-PSK (TKIP) / WPA-PSK (AES) Pre-Shared Key

Wireless Security	
Parameters	
Security Mode	WPA1 Pre-Shared Key <input type="button" value="v"/> or WPA2 Pre-Shared Key <input type="button" value="v"/>
WPA Algorithms	TKIP or AES
WPA Shared Key	<input type="text"/>
Group Key Renewal	3600 seconds
Idle Timeout	3600 seconds (120~65535)
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

WPA Algorithms: There are two types of the WPA-PSK; the WAP1 adapts the TKIP (Temporal Key Integrity Protocol) encrypted algorithms, which incorporates Message Integrity Code (MIC) to provide protection against hackers. The WAP2 adapts CCMP (Cipher Block Chaining Message Authentication Code Protocol) of the AES (Advanced Encryption Security) algorithms.

WPA Shared Key: The key for network authentication. The input format is in character style and key size should be in the range between 8 and 63 characters.

Group Key Renewal: The period of renewal time for changing the security key automatically between wireless client and Access Point (AP). Default value is **3600** seconds.

Idle Timeout: The default idle timeout is **3600** seconds. A Timeout value base on the case of no data traffic is send or received. If Router detects no traffic in the wireless, it will start timing the clock and drop the session as it reaches to the defined timeout value. New session will be re-established after the old session.

WEP

Wireless Security	
Parameters	
Security Mode	WEP <input type="button" value="v"/>
WEP Authentication	Open System <input type="button" value="v"/>
WEP Encryption	<input checked="" type="radio"/> WEP64 <input type="radio"/> WEP128 Hex <input type="button" value="v"/>
Passphrase	<input type="text"/> <input type="button" value="Generate"/>
Default Used WEP Key	1 (1~4)
Key 1	<input type="text" value="00-00-00-00-00"/>
Key 2	<input type="text" value="00-00-00-00-00"/>
Key 3	<input type="text" value="00-00-00-00-00"/>
Key 4	<input type="text" value="00-00-00-00-00"/>
(WEP 64 - Hex): 5 Hex code, (1~9, a~z, A~Z), separated by hyphen, -, are required. Either use the Passphrase or manually insert your WEP key. EX: 11-aa-22-cc-33.	
*: WDS uses Key1 for WEP encryption.	
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

WEP Encryption: To prevent unauthorized wireless stations from accessing data transmitted over the network, the router offers highly secure data encryption, known as WEP. If you require high security for transmissions, there are two alternatives to select from: **WEP 64** and **WEP 128**. WEP 128 will offer increased security over WEP 64.

Passphrase: This is used to generate WEP keys automatically based upon the input string and a pre-defined algorithm in WEP64 or WEP128. You can input the same string in both the AP and Client card settings to generate the same WEP keys. Please note that you do not have to enter **Key (1-4)** as below when the **Passphrase** is enabled.

Default Used WEP Key: Select the encryption key ID; please refer to **Key (1-4)** below.

Key (1-4): Enter the key to encrypt wireless data. To allow encrypted data transmission, the WEP Encryption Key values on all wireless stations must be the same as the router. There are four keys for your selection. The input format is in HEX style, 5 and 13 HEX codes are required for WEP64 and WEP128 respectively, the separator is "-". For example, using WEP64, 11-22-33-44-55 is a valid key, whilst 1122334455 is invalid.

Wireless Client / MAC Address Filter (Wireless Router Only)

The MAC Address supports up to 16 wireless network machines and helps you to manage your network control to accept traffic from specific authorized machines or to restrict unwanted machine(s) to access your LAN.

There are no pre-define MAC Address filter rules; you can add the filter rules to meet your requirements.

Wireless Client (MAC Address) Filter

Filtering Rules

Filter Action	<input checked="" type="radio"/> Disable	<input type="radio"/> Allowed	<input type="radio"/> Blocked
MAC Address List Candidates ▶ (MAC Address Format is 'xx:xx:xx:xx:xx:xx')	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>
	<input type="text"/>	<input type="text"/>	<input type="text"/>

Wireless Client Filter: Default setting is set to **Disable**.

Ⓞ Allowed: To authorize specific device accessing your LAN by insert the MAC Address in the space provided or click [Candidates](#) ▶. Make sure your PC's MAC is listed.

Ⓞ Blocked: To prevent unwanted device accessing the LAN by insert the MAC Address in the space provided or click [Candidates](#) ▶. Make sure your PC's MAC is not listed.

The maximum client is 16. The MAC addresses are 6 bytes long; they are presented only in hexadecimal characters. The number **0 - 9** and letters **a - f** are acceptable.

The maximum client is 16. The MAC addresses are 6 bytes long; they are presented only in hexadecimal characters. The number **0 - 9** and letters **a - f** are acceptable.

Note: Follow the MAC Address Format xx:xx:xx:xx:xx:xx. Semicolon (:) must be included.

Candidates: it automatically detects devices connected to the router through the Wireless.

[Candidates](#) ▶ → **Associated Wireless Clients**

Associate Wireless Client displays a list of individual wireless device's MAC Address that currently connects to the router.

You can easily by checking the box next to the MAC address to be blocked or allowed. Then, **Add** to insert to the Wireless Client (MAC Address) Filter table. The maximum wireless client is 16.

DHCP Server

You can disable or enable the DHCP (Dynamic Host Configuration Protocol) server or enable the router's DHCP relay functions. The DHCP protocol allows your router to dynamically assign IP addresses to PCs on your network if they are configured to obtain IP addresses automatically.

DHCP Server	
Configuration	
DHCP Server Mode	<input type="radio"/> Disable <input checked="" type="radio"/> DHCP Server <input type="radio"/> DHCP Relay Agent
<input type="button" value="Next"/>	

DHCP Server Status	
Allow Bootp	true
Allow Unknown Clients	true
Enable	true
Subnet Definitions	
Subnet Value	192.168.1.0
SubNetmask	255.255.255.0
Maximum Lease Time	86400 seconds
Default Lease Time	43200 seconds
Use local host address as DNS server	true
Use local host address as default gateway	true
Get subnet from IP interface	iplan
IP Range 192.168.1.100- 192.168.1.199	
Option <i>domain-name-servers</i> = 0.0.0.0	

To disable the router's DHCP Server, check **Disabled** and click **Next**, then click **Apply**. When the DHCP Server is disabled you will need to manually assign a fixed IP address to each PCs on your network, and set the default gateway for each PCs to the IP address of the router (by default this is 192.168.1.254).

To configure the router's DHCP Server, check **DHCP Server** and click **Next**. You can then configure parameters of the DHCP Server including the IP pool (starting IP address and ending IP address to be allocated to PCs on your network), lease time for each assigned IP address (the period of time the IP address assigned will be valid), DNS IP address and the gateway IP address. These details are sent to the DHCP client (i.e. your PC) when it requests an IP address from the DHCP server. Click **Apply** to enable this function. If you check "**Use Router as a DNS Server**", the Router will perform the domain name lookup, find the IP address from the outside network automatically and forward it back to the requesting PC in the LAN (your Local Area Network).

If you check **DHCP Relay Agent** and click **Next**, then you will have to enter the IP address of the DHCP server which will assign an IP address back to the DHCP client in the LAN. Use this function only if advised to do so by your network administrator or ISP.

Click **Apply** to enable this function.

System

Here are items within the **System** section: [Time Zone](#), [Remote Access](#), [Firmware Upgrade](#), [Backup/Restore](#), [Restart](#) and [User Management](#).

Time Zone

Time Zone	
Parameters	
Time Zone	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
Time Zone List	<input checked="" type="radio"/> By City <input type="radio"/> By Time Difference
Local Time Zone (+-GMT Time)	(GMT)Greenwich Mean Time ▼
SNTP Server IP Address	1. <input type="text" value="carl.css.gov"/> 2. <input type="text" value="india.colorado.edu"/>
	3. <input type="text" value="time.nist.gov"/> 4. <input type="text" value="time-b.nist.gov"/>
Daylight Saving	<input checked="" type="checkbox"/> Automatic
Resync Period	<input type="text" value="1440"/> minutes
	
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

The router does not have a real time clock on board; instead, it uses the Simple Network Time Protocol (SNTP) to get the current time from an SNTP server outside your network. Choose your local time zone, click **Enable** and click the **Apply** button. After a successful connection to the Internet, the router will retrieve the correct local time from the SNTP server you have specified. If you prefer to specify an SNTP server other than those in the list, simply enter its IP address as shown above. Your ISP may provide an SNTP server for you to use.

Daylight Saving is also known as **Summer Time Period**. Many places in the world adapt it during summer time to move one hour of daylight from morning to the evening in local standard time. Check **Automatic** box to auto set your local time.

Resync Period (in minutes) is the periodic interval the router will wait before it re-synchronizes the router's time with that of the specified SNTP server. In order to avoid unnecessarily increasing the load on your specified SNTP server you should keep the poll interval as high as possible – at the absolute minimum every few hours or even days.

Remote Access

Remote Access

You may temporarily permit remote administration of this network device

Allow Access for minutes.

To temporarily permit remote administration of the router (i.e. from outside your LAN), select a time period the router will permit remote access for and click **Enable**. You may change other configuration options for the web administration interface using **Device Management** options in the **Advanced** section of the GUI.

If you wish to permanently enable remote access, choose a time period of 0 minutes. This setting cannot be saved into flash when timer set to zero.

Firmware Upgrade

Firmware Upgrade

You may upgrade the system software on your network device

New Firmware Image

Browse...

Upgrade

Your router's "firmware" is the software that allows it to operate and provides all its functionality. Think of your router as a dedicated computer, and the firmware as the software it runs. Over time this software may be improved and modified, and your router allows you to upgrade the software it runs to take advantage of these changes.

Clicking on **Browse** will allow you to select the new firmware image file you have downloaded to your PC. Once the correct file is selected, click Upgrade to update the firmware in your router.

Warning

DO NOT power down the router or interrupt the firmware upgrading while it is still in process. Improper operation could damage the router.

Backup / Restore

Backup/Restore

Allows you to backup the configuration settings to your computer, or restore configuration from your computer.

Backup Configuration

Backup configuration to your computer.

Restore Configuration

Configuration File

"Restore" will overwrite the current configuration and restart the device. If you want to keep the current configuration, please use "Backup" first to save current configuration.

These functions allow you to save and backup your router's current settings to a file on your PC, or to restore a previously saved backup. This is useful if you wish to experiment with different settings, knowing that you have a backup handy in the case of any mistakes. It is advisable to backup your router's settings before making any significant changes to your router's configuration.

Press **Backup** to select where on your local PC to save the settings file. You may also change the name of the file when saving if you wish to keep multiple backups.

Press **Browse** to select a file from your PC to restore. You should only restore settings files that have been generated by the Backup function, and that were created when using the **current version** of the router's firmware. **Settings files saved to your PC should not be manually edited in any way.**

After selecting the settings file you wish to use, pressing **Restore** will load those settings into the router.

Restart Router

Click **Restart** with option **Current Settings** to reboot your router (and restore your last saved configuration).

Restart Router

After restarting, please wait for a few seconds for system to come up. If you would like to reset all configuration to factory default settings, please select the "Factory Default Settings" option.

Restart Router with	<input checked="" type="radio"/> Current Settings
	<input type="radio"/> Factory Default Settings

If you wish to restart the router using the factory default settings (for example, after a firmware upgrade or if you have saved an incorrect configuration), select **Factory Default Settings** to reset to factory default settings.

You may also reset your router to factory settings by holding the small Reset pinhole button on the back of your router in for 6 seconds whilst the router is turned on.

User Management

User Management				
Current Defined Users				
Valid	User	Comment		
true	admin	Default admin user	Edit 	
Create 				

In order to prevent unauthorized access to your router's configuration interface, it requires all users to login with a password. You can set up multiple user accounts, each with their own password.

You are able to **Edit** existing users and **Create** new users who are able to access the device's configuration interface. Once you have clicked on **Edit**, you are shown the following options:

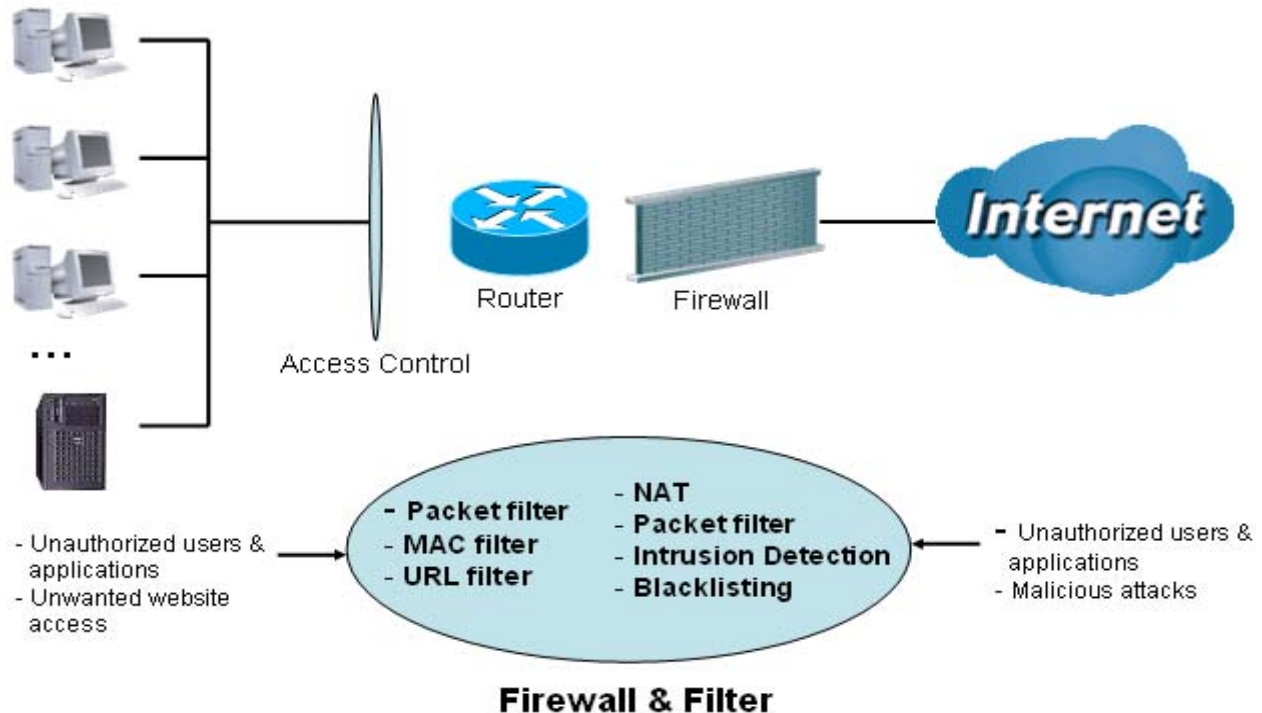

User Management	
Edit	
Username	admin
Password	<input type="password" value="*****"/>
Confirm	<input type="password" value="*****"/>
Valid	true 
Comment	Default admin user
<input type="button" value="Apply"/> <input type="button" value="Reset"/>	

You can change the user's **password**, whether their account is active and **Valid**, as well as add a comment to each user account. These options are the same when creating a user account, with the exception that once created you cannot change the username. You cannot delete the default admin account; however, you can delete any other created accounts by clicking **Delete** when editing the user.

You are strongly advised to change the password on the default "**admin**" account when you receive your router, and any time you reset your configuration to Factory Defaults.

Firewall and Access Control

Your router includes a full SPI (Stateful Packet Inspection) firewall for controlling Internet access from your LAN, as well as helping to prevent attacks from hackers. In addition to this, when using NAT, the router acts as a “natural” Internet firewall, as all PCs on your LAN will use private IP addresses that cannot be directly accessed from the Internet.

Firewall: Prevents access from outside your network. The router provides three levels of security support:

NAT natural firewall: This masks LAN users' IP addresses which is invisible to outside users on the Internet, making it much more difficult for a hacker to target a machine on your network. This natural firewall is on when NAT function is enabled.

NOTE:

When using Virtual Servers your PCs will be exposed to the degree specified in your Virtual Server settings provided the ports specified are opened in your firewall packet filter settings.

Firewall Security and Policy (General Settings): Inbound direction of Packet Filter rules to prevent unauthorized computers or applications accessing your local network from the Internet.

Intrusion Detection: Enable Intrusion Detection to detect, prevent and log malicious attacks.

Access Control: Prevents access from PCs on your local network:

Firewall Security and Policy (General Settings): Outbound direction of Packet Filter rules to prevent unauthorized computers or applications accessing the Internet.

URL Filter: To block PCs on your local network from unwanted websites.

Here are items under the **Firewall** section: [General Settings](#), [Packet Filter](#), [Intrusion Detection](#), [URL Filter](#), [IM/P2P Blocking](#) and [Firewall Log](#).

General Settings

You can choose not to enable Firewall and still able to access to URL Filter and IM/P2P Blocking or enable the Firewall using preset filter rules and modify the port filter rules as required. The Packet Filter is used to filter packets based-on Applications (Port) or IP addresses

There are four options when you enable the Firewall, they are:

- ⊙ **All blocked/User-defined:** no pre-defined port or address filter rules by default, meaning that all inbound (Internet to LAN) and outbound (LAN to Internet) packets will be blocked. Users have to add their own filter rules for further access to the Internet.
- ⊙ **High/Medium/Low security level:** the predefined port filter rules for High, Medium and Low security are displayed in Port Filters of Packet Filter.

Select either **High, Medium** or **Low security level** to enable the Firewall. The only difference between these three security levels is the preset port filter rules in the Packet Filter. Firewall functionality is the same for all levels; it is only the list of preset port filters that changes between each setting. For more detailed on level of preset port filter information, refer to **Table 1: Predefined Port Filter**.

If you choose of the preset security levels and then add custom filters, you may temporarily disable the firewall and recover your custom filter settings by re-selecting the same security level.

The “**Block WAN Request**” is a stand-alone function and not relate to whether security enable or disable. Mostly it is for preventing any scan tools from WAN site by hacker.

General Settings	
Firewall Security	
Security	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Policy	All blocked/User-defined
	High security level
	<input checked="" type="radio"/> Medium security level
	Low security level
<p>( If some applications cannot work after enabling Firewall, please check the Packet Filter especially Port Filter rules. For example, adding (TCP:443,outbound allowed) will let HTTPS data go through Firewall.)</p>	
Block WAN Request	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
<p>( Enable for preventing any ping test from Internet, such as hacker attack.)</p>	
<input type="button" value="Apply"/>	

Any remote user who is attempting to perform this action may result in blocking all the accesses to configure and manage of the device from the Internet.

Packet Filter

This function is only available when the Firewall is enabled and one of these four security levels is chosen (All blocked, High, Medium and Low). The predefined port filter rules in the Packet Filter must modify accordingly to the level of Firewall, which is selected. See **Table1: Predefined Port Filter** for more detailed information.

Packet Filter

[Add TCP/UDP Filter ▶](#)
[Add Raw IP Filter ▶](#)

Packet Filter Rules

Rule Name	Time Schedule	Source IP / Netmask	Protocol	Source port(s)	Inbound	Edit ▶	Delete ▶
		Destination IP / Netmask		Destination port(s)	Outbound

		0.0.0.0 / 0.0.0.0		25 ~ 25	Allow		
lei_pop3	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit ▶	Delete ▶
		0.0.0.0 / 0.0.0.0		110 ~ 110	Allow		

Example: Predefined Port Filters Rules

The predefined port filter rules for High, Medium and Low security levels are listed. See Table 1.

Note: Firewall – All Blocked/User-defined, you must define and create the port filter rules yourself. No predefined rule is being preconfigured.

Table 1: Predefined Port Filter

Application	Protocol	Port Number		Firewall - Low		Firewall - Medium		Firewall – High	
		Start	End	Inbound	Outbound	Inbound	Outbound	Inbound	Outbound
HTTP(80)	TCP(6)	80	80	NO	YES	NO	YES	NO	YES
DNS (53)	UDP(17)	53	53	NO	YES	NO	YES	NO	YES
DNS (53)	TCP(6)	53	53	NO	YES	NO	YES	NO	YES
FTP(21)	TCP(6)	21	21	NO	YES	NO	YES	NO	NO
Telnet(23)	TCP(6)	23	23	NO	YES	NO	YES	NO	NO
SMTP(25)	TCP(6)	25	25	NO	YES	NO	YES	NO	YES
POP3(110)	TCP(6)	110	110	NO	YES	NO	YES	NO	YES
NEWS(NNTP) (Network News Transfer Protocol)	TCP(6)	119	119	NO	YES	NO	YES	NO	NO
RealAudio/ RealVideo (7070)	UDP(17)	7070	7070	YES	YES	YES	YES	NO	NO
PING	ICMP(1)	N/A	N/A	NO	YES	NO	YES	NO	YES
H.323(1720)	TCP(6)	1720	1720	YES	YES	NO	YES	NO	NO
T.120(1503)	TCP(6)	1503	1503	YES	YES	NO	YES	NO	NO
SSH(22)	TCP(6)	22	22	NO	YES	NO	YES	NO	NO
NTP/SNTP	UDP(17)	123	123	NO	YES	NO	YES	NO	YES
HTTP/HTTP Proxy (8080)	TCP(6)	8080	8080	NO	YES	NO	NO	NO	NO
HTTPS(443)	TCP(6)	443	443	NO	YES	NO	YES	N/A	N/A
ICQ (5190)	TCP(6)	5190	5190	YES	YES	N/A	N/A	N/A	N/A
MSN (1863)	TCP(6)	1863	1863	YES	YES	N/A	N/A	N/A	N/A

VoIP/(802.11g) Broadband Firewall Router

MSN (7001)	UDP(17)	7001	7001	YES	YES	N/A	N/A	N/A	N/A
MSN VEDIO (9000)	TCP(6)	9000	9000	NO	YES	N/A	N/A	N/A	N/A

Inbound: Internet to LAN ; **Outbound:** LAN to Internet.
YES: Allowed ; **NO:** Blocked ; **N/A:** Not Applicable

Packet Filter – Add TCP/UDP Filter

Packet Filter

Rule Name Helper ▶	<input type="text"/>		
Time Schedule	Always On ▼		
Source IP Address(es)	<input type="text" value="0.0.0.0"/>	Netmask	<input type="text" value="0.0.0.0"/>
Destination IP Address(es)	<input type="text" value="0.0.0.0"/>	Netmask	<input type="text" value="0.0.0.0"/>
Type	TCP ▼		
Source Port	<input type="text" value="0"/>	-	<input type="text" value="65535"/>
Destination Port	<input type="text" value="0"/>	-	<input type="text" value="65535"/>
Inbound	Allow ▼		
Outbound	Allow ▼		
<input type="button" value="Apply"/> Return ▶			

Rule Name: Users-define description to identify this entry or click [Helper](#) ▶ to select existing predefined rules. The maximum name length is 32 characters.

Time Schedule: It is self-defined time period. You may specify a time schedule for your prioritization policy. For setup and detail, refer to **Time Schedule** section

Source IP Address(es) / Destination IP Address(es): This is the Address-Filter used to allow or block traffic to/from particular IP address(es). Selecting the **Subnet Mask** of the IP address range you wish to allow/block the traffic to or from; set IP address and Subnet Mask to **0.0.0.0** to inactive the Address-Filter rule.

Tip: To block access, to/from a single IP address, enter that IP address as the **Host IP Address** and use a **Host Subnet Mask** of "255.255.255.255".

Type: It is the packet protocol type used by the application, select **TCP**, **UDP** or both **TCP/UDP**.

Source Port: This Port or Port Ranges defines the port allowed to be used by the Remote/WAN to connect to the application. Default is set from range **0 ~ 65535**. It is recommended that this option be configured by an advanced user.

Destination Port: This is the Port or Port Ranges that defines the application.

Inbound / Outbound: Select **Allow** or **Block** the access to the Internet ("**Outbound**") or from the Internet ("**Inbound**").

Click **Apply** button to apply your changes.

Packet Filter – Add Raw IP Filter

Packet Filter	
Add Raw IP Filter	
Rule Name Helper ▶	<input type="text"/>
Time Schedule	Always On ▼
Protocol Number	<input type="text"/>
Inbound	Allow ▼
Outbound	Allow ▼
<input type="button" value="Apply"/> Return ▶	

Rule Name: Users-define description to identify this entry or click [Helper](#) ▶ to select existing predefined rules.

Time Schedule: It is self-defined time period. You may specify a time schedule for your prioritization policy. For setup and detail, refer to **Time Schedule** section

Protocol Number: Insert the port number, i.e. GRE 47.

Inbound / Outbound: Select **Allow** or **Block** the access to the Internet (“**Outbound**”) or from the Internet (“**Inbound**”).

Click **Apply** button to apply your changes.

Example: Configuring your firewall to allow for a publicly accessible web server on your LAN

The predefined port filter rule for HTTP (TCP port 80) is the same no matter whether the firewall is set to a high, medium or low security level. To setup a web server located on the local network when the firewall is enabled, you have to configure the Port Filters setting for HTTP.

As you can see from the diagram below, when the firewall is enabled with one of the three presets (Low/Medium/High), inbound HTTP access is not allowed which means remote access through HTTP to your router is not allowed.

Note: Inbound indicates accessing from Internet to LAN and Outbound is from LAN to the Internet.

Packet Filter Rules							
Rule Name	Time Schedule	Source IP / Netmask	Protocol	Source port(s)	Inbound	Edit 	Delete 
		Destination IP / Netmask		Destination port(s)	Outbound		
mei_http	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		80 ~ 80	Allow		
mei_dns	Always On	0.0.0.0 / 0.0.0.0	UDP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		53 ~ 53	Allow		
mei_tdns	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		53 ~ 53	Allow		
mei_ftp	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		21 ~ 21	Allow		
mei_tnet	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		23 ~ 23	Allow		
mei_smtp	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		25 ~ 25	Allow		
mei_pop3	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		110 ~ 110	Allow		
mei_nttp	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit 	Delete 
		0.0.0.0 / 0.0.0.0		119 ~ 119	Allow		

Configuring Packet Filter:

1. Click **Port Filters**. You will then be presented with the predefined port filter rules screen (in this case for the low security level), shown below:

Note: You may click **Edit** the predefined rule instead of **Delete** it. This is an example to show to how you add a filter on your own.

Packet Filter

Add TCP/UDP Filter ▶
Add Raw IP Filter ▶

Packet Filter Rules							
Rule Name	Time Schedule	Source IP / Netmask	Protocol	Source port(s)	Inbound	Edit ▶	Click Delete ↓
		Destination IP / Netmask		Destination port(s)	Outbound		Delete ▶
mei_http	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit ▶	Delete ▶
		0.0.0.0 / 0.0.0.0		80 ~ 80	Allow		Delete ▶
mei_dns	Always On	0.0.0.0 / 0.0.0.0	UDP	0 ~ 65535	Block	Edit ▶	Delete ▶
		0.0.0.0 / 0.0.0.0		53 ~ 53	Allow		Delete ▶
mei_tdns	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit ▶	Delete ▶
		0.0.0.0 / 0.0.0.0		53 ~ 53	Allow		Delete ▶
mei_ftp	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Block	Edit ▶	Delete ▶
		0.0.0.0 / 0.0.0.0		21 ~ 21	Allow		Delete ▶

		0.0.0.0 / 0.0.0.0		23 ~ 23	Allow		Delete ▶

2. Click **Delete** to delete the existing HTTP rule.
3. Click **Add TCP/UDP Filter**.

Packet Filter

Click Add TCP/UDP Filter

Add TCP/UDP Filter ▶
Add Raw IP Filter ▶

4. Input the Rule Name, Time Schedule, Source/Destination IP, Type, Source/Destination Port, Inbound and Outbound.

Example:

Application: *Cindy_HTTP*
 Time Schedule: *Always On*
 Source / Destination IP Address(es): *0.0.0.0 (I do not wish to activate the address-filter, instead I use the port-filter)*
 Type: *TCP (Please refer to Table1: Predefined Port Filter)*
 Source Port: *0-65535 (I allow all ports to connect with the application)*
 Redirect Port: *80-80 (This is Port defined for HTTP)*
 Inbound / Outbound: *Allow*

Packet Filter

Add TCP/UDP Filter

Rule Name	Cindy_HTTP		
Time Schedule	Always On ▼		
Source IP Address(es)	0.0.0.0	Netmask	0.0.0.0
Destination IP Address(es)	0.0.0.0	Netmask	0.0.0.0
Type	TCP ▼		
Source Port	0 - 65535		
Destination Port	80 - 80		
Inbound	Allow ▼		
Outbound	Allow ▼		

5. The new port filter rule for HTTP is shown below:

Cindy_HTTP	Always On	0.0.0.0 / 0.0.0.0	TCP	0 ~ 65535	Allow	<input type="button" value="Edit"/> <input type="button" value="Delete"/>
		0.0.0.0 / 0.0.0.0		80 ~ 80	Allow	

6. Configure your Virtual Server (“port forwarding”) settings so that incoming HTTP requests on port 80 will be forwarded to the PC running your web server:

Note: For how to configure the HTTP in Virtual Server, go to Add Virtual Server in Virtual Server section for more details.

Virtual Server (Port Forwarding)

Virtual Server Table

Application	Time Schedule	Protocol	External Port	Redirect Port	IP Address		
HTTP_Server	Always On	tcp	80 - 80	80 - 80	192.168.1.254	<input type="button" value="Edit"/>	<input type="button" value="Delete"/>

Intrusion Detection

Intrusion Detection	
Parameters	
Intrusion Detection	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Victim Protection Block Duration	<input type="text" value="600"/> seconds
Scan Attack Block Duration	<input type="text" value="86400"/> seconds
DOS Attack Block Duration	<input type="text" value="1800"/> seconds
Maximum TCP Open Handshaking Count	<input type="text" value="100"/> per second
Maximum Ping Count	<input type="text" value="15"/> per second
Maximum ICMP Count	<input type="text" value="100"/> per second
<input type="button" value="Apply"/>	
<input type="button" value="Clear Blacklist"/>	

The router's *Intrusion Detection System* (IDS) is used to detect hacker attacks and intrusion attempts from the Internet. If the IDS function of the firewall is enabled, inbound packets are filtered and blocked depending on whether they are detected as possible hacker attacks, intrusion attempts or other connections that the router determines to be suspicious.

Blacklist: If the router detects a possible attack, the source IP or destination IP address will be added to the Blacklist. Any further attempts using this IP address will be blocked for the time period specified as the **Block Duration**. The default setting for this function is false (disabled). Some attack types are denied immediately without using the Blacklist function, such as *Land attack* and *Echo/CharGen scan*.

Intrusion Detection: If enabled, IDS will block Smurf attack attempts. Default is false.

Block Duration:

- ⊙ **Victim Protection Block Duration:** This is the duration for blocking *Smurf* attacks. Default value is 600 seconds.
- ⊙ **Scan Attack Block Duration:** This is the duration for blocking hosts that attempt a possible Scan attack. Scan attack types include *X'mas scan*, *IMAP SYN/FIN scan* and similar attempts. Default value is 86400 seconds.
- ⊙ **DoS Attack Block Duration:** This is the duration for blocking hosts that attempt a possible Denial of Service (DoS) attack. Possible DoS attacks this attempts to block include *Ascend Kill* and *WinNuke*. Default value is 1800 seconds.

Max TCP Open Handshaking Count: This is a threshold value to decide whether a *SYN Flood* attempt is occurring or not. Default value is 100 TCP SYN per seconds.

Max PING Count: This is a threshold value to decide whether an *ICMP Echo Storm* is occurring or not. Default value is 15 ICMP Echo Requests (PING) per second.

Max ICMP Count: This is a threshold to decide whether an *ICMP flood* is occurring or not. Default value is 100 ICMP packets per seconds except ICMP Echo Requests (PING).

For *SYN Flood*, *ICMP Echo Storm* and *ICMP flood*, IDS will just warn the user in the Event Log. It cannot protect against such attacks.

Table 2: Hacker attack types recognized by the IDS

Intrusion Name	Detect Parameter	Blacklist	Type of Block Duration	Drop Packet	Show Log
Ascend Kill	Ascend Kill data	Src IP	DoS	Yes	Yes
WinNuke	TCP Port 135, 137~139, Flag: URG	Src IP	DoS	Yes	Yes
Smurf	ICMP type 8 Des IP is broadcast	Dst IP	Victim Protection	Yes	Yes
Land attack	SrcIP = DstIP			Yes	Yes
Echo/CharGen Scan	UDP Echo Port and CharGen Port			Yes	Yes
Echo Scan	UDP Dst Port = Echo(7)	Src IP	Scan	Yes	Yes
CharGen Scan	UDP Dst Port = CharGen(19)	Src IP	Scan	Yes	Yes
X'mas Tree Scan	TCP Flag: X'mas	Src IP	Scan	Yes	Yes
IMAP SYN/FIN Scan	TCP Flag: SYN/FIN DstPort: IMAP(143) SrcPort: 0 or 65535	Src IP	Scan	Yes	Yes
SYN/FIN/RST/ACK Scan	TCP, No Existing session And Scan Hosts more than five.	Src IP	Scan	Yes	Yes
Net Bus Scan	TCP No Existing session DstPort = Net Bus 12345,12346, 3456	SrcIP	Scan	Yes	Yes
Back Orifice Scan	UDP, DstPort = Orifice Port (31337)	SrcIP	Scan	Yes	Yes
SYN Flood	Max TCP Open Handshaking Count (Default 100 c/sec)				Yes
ICMP Flood	Max ICMP Count (Default 100 c/sec)				Yes
ICMP Echo	Max PING Count (Default 15 c/sec)				Yes

Src IP: Source IP
Dst Port: Destination Port

Src Port: Source Port
Dst IP: Destination IP

URL Filter

URL (Uniform Resource Locator – e.g. an address in the form of <http://www.abcde.com> or <http://www.example.com>) filter rules allow you to prevent users on your network from accessing particular websites by their URL. There are no pre-defined URL filter rules; you can add filter rules to meet your requirements.

URL Filter	
Configuration	
URL Filtering	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Block Mode	Always On ▾
Keywords Filtering	<input type="checkbox"/> Enable Details ▶
Domains Filtering	<input type="checkbox"/> Enable Details ▶
	<input type="checkbox"/> Disable all WEB traffic except for Trusted Domains
Restrict URL Features	<input type="checkbox"/> Block Java Applet
	<input type="checkbox"/> Block surfing by IP address
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	
Exception List	
Name	IP Address
<input type="button" value="Add"/>	

Enable/Disable: To enable or disable URL Filter feature.

Block Mode: A list of the modes that you can choose to check the URL filter rules. The default is set to **Always On**.

Disabled: No action will be performed by the Block Mode.

Always On: Action is enabled. URL filter rules will be monitoring and checking at all hours of the day.

TimeSlot1 ~ TimeSlot16: It is self-defined time period. You may specify the time period to check the URL filter rules, i.e. during working hours. For setup and detail, refer to **Time Schedule** section.

Keywords Filtering: Allows blocking by specific keywords within a particular URL rather than having to specify a complete URL (e.g. to block any image called “advertisement.gif”). When enabled, your specified keywords list will be checked to see if any keywords are present in URLs accessed to determine if the connection attempt should be blocked. Please note that the URL filter blocks web browser (HTTP) connection attempts using port 80 only.

For example, if the URL is <http://www.abc.com/abcde.html>, it will be dropped as the keyword “abcde” occurs in the URL.

Domains Filtering: This function checks the whole URL not the IP address, in URLs accessed against your list of domains to block or allow. If it is matched, the URL request will be sent (Trusted) or dropped (Forbidden). For this function to be activated, both check-boxes must be checked. Here is the checking procedure:

1. Check the domain in the URL to determine if it is in the trusted list. If yes, the connection attempt is sent to the remote web server.
2. If not, check if it is listed in the forbidden list. If yes, then the connection attempt will be

dropped.

3. If the packet does not match either of the above two items, it is sent to the remote web server.
4. Please be note that the completed URL, “www” + domain name, shall be specified. For example to block traffic to www.google.com.au, enter “www.google” or “www.google.com”

In the example below, the URL request for www.abc.com will be sent to the remote web server because it is listed in the trusted list, whilst the URL request for www.google or www.google.com will be dropped, because www.google is in the forbidden list.

Domains Filtering

Domain Name	
Domain Name	<input type="text" value="www.google"/>
Type	Forbidden Domain ▾
<input type="button" value="Apply"/>	

Trusted Domain

Name	Domain	
Item0	www.abc	Delete ▶

Forbidden Domain

Name	Domain	
Item1	www.google	Delete ▶

Example: Andy wishes to disable all WEB traffic except for ones listed in the trusted domain, which would prevent Bobby from accessing other web sites. Andy selects both functions in the *Domain Filtering* and thinks that it will stop Bobby. But Bobby knows this function, *Domain Filtering*, ONLY disables all WEB traffic except for **Trusted Domain**, BUT not its **IP address**. If this is the situation, **Block surfing by IP address** function can be handy and helpful to Andy. Now, Andy can prevent Bobby from accessing other sites.

Restrict URL Features: This function enhances the restriction to your URL rules.

Ⓞ **Block Java Applet:** This function can block Web content that includes the Java Applet. It is to prevent someone who wants to damage your system via standard HTTP protocol.

Ⓞ **Block surfing by IP address:** Preventing someone who uses the IP address as URL for skipping Domains Filtering function. Activates only and if Domain Filtering enabled.

IM / P2P Blocking

IM, short for Instant Message, is required to use client program software that allows users to communicate, in exchanging text message, with other IM users in real time over the Internet. A P2P application, known as Peer-to-peer, is group of computer users who share file to specific groups of people across the Internet. Both Instant Message and Peer-to-peer applications make communication faster and easier but your network can become increasingly insecure at the same time. Billion's IM and P2P blocking helps users to restrict LAN PCs to access to the commonly used IM, Yahoo and MSN, and P2P, BitTorrent and eDonkey, applications over the Internet.

IM/P2P Blocking	
Configuration	
Instant Message Blocking	Disabled ▾
Yahoo Messenger	<input type="checkbox"/> Block
MSN Messenger	<input type="checkbox"/> Block
Peer to Peer Blocking	Disabled ▾
BitTorrent (BitTorrent, BitComet)	<input type="checkbox"/> Block
eDonkey (eDonkey, eMule)	<input type="checkbox"/> Block

Instant Message Blocking: The default is set to **Disabled**.

- Ⓒ **Disabled:** Instant Message blocking is not triggered. No action will be performed.
- Ⓒ **Always On:** Action is enabled.
- Ⓒ **TimeSlot1 ~ TimeSlot16:** This is the self-defined time period. You may specify the time period to trigger the blocking, i.e. during working hours. For setup and detail, refer to **Time Schedule** section.

Yahoo/MSN Messenger: Check the box to block either or both Yahoo or/and MSN Messenger. To be sure you enabled the *Instant Message Blocking* first.

Peer to Peer Blocking: The default is set to **Disabled**.

- Ⓒ **Disabled:** Instant Message blocking is not triggered. No action will be performed.
- Ⓒ **Always On:** Action is enabled.
- Ⓒ **TimeSlot1 ~ TimeSlot16:** This is the self-defined time period. You may specify the time period to trigger the blocking, i.e. during working hours. For setup and detail, refer to **Time Schedule** section.

BitTorrent / eDonkey: Check the box to block either or both Bit Torrent or/and eDonkey. To be sure you enabled the *Peer to Peer Blocking* first.

Log information can be seen in the **Status – Event Log** after enabling.

VoIP (Voice over Internet Protocol)

VoIP enables telephone calls through existing Internet connection instead of going through the PSTN (Public Switched Telephone Network). It is not only cost-effective, especially for a long distance telephone charges, but also toll-quality voice calls over the Internet.

After completing VoIP configuration, remember to apply the changes, SAVE CONFIG and restart to activate your VoIP.

Attention

Here are items within the **VoIP** section: [Wizard](#), [General Settings](#), [Phone Port](#), [PSTN Dial Plan](#), [VoIP Dial Plan](#) and [Ring & Tone](#).

Wizard

This section provides easy setup for your VoIP service. Phone port 1 and 2 can be registered to different SIP Service Provider.

VoIP Wizard	
Voice QoS	
DSCP Marking	Premium <input type="button" value="v"/>
Setting for Phone Port 1 Select Profile <input type="button" value="▶"/>	
SIP Service Provider	sip.internode.on.net <input type="button" value="v"/>
Phone Number	<input type="text"/>
Authentication Username	<input type="text"/> (If empty, same as Phone Number.)
Authentication Password	<input type="text"/>
Setting for Phone Port 2 Select Profile <input type="button" value="▶"/> <input type="checkbox"/> Same as Phone Port 1	
SIP Service Provider	FWD <input type="button" value="v"/>
Phone Number	<input type="text"/>
Authentication Username	<input type="text"/> (If empty, same as Phone Number.)
Authentication Password	<input type="text"/>
 <i>Caution! The VoIP configuration will take effect only when you apply the changes, save configuration and restart the device.</i>	
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> VoIP User-defined Profiles <input type="button" value="▶"/>	

Voice QoS

DSCP Marking: Differentiated Services Code Point (DSCP), it is the first 6 bits in the ToS byte. DSCP Marking allows users to assign specific application traffic to be executed in priority by the next Router based on the DSCP value.

Note: To be sure the router(s) in the backbones network have the capability in executing and checking the DSCP through-out the QoS network.

Setting for Phone Port 1

SIP Service Provider: This section allows you to select the service provider. When the selection is done, respective parameters below are automatically displayed.

Select Profile: It allows you to select a desired VoIP provider whom is not defined already in the **SIP Service Provider**. You may manually setup the SIP accounts by entering VoIP SIP information to **User-defined Profile**. See below for details.

Phone Number: This parameter holds the registration ID of the user within the VoIP SIP registrar.

Authentication Username: If the username is same as the Phone Number, leave it blank. Otherwise, fill in the space with your username given by your VoIP provider.

Authentication Password: This parameter holds the password used for authentication within VoIP SIP registrar.

Setting for Phone Port 2

Click box of **Same as Phone Port 1** to set phone port 2 be identical as phone port 1.

Please refer to descriptions in “Setting for Phone Port 1”.

User-defined Profiles

NOTE: User defined profiles are limited to 8 only.

VoIP User-defined Profiles	
Profile List	
Name	Registrar Address
Phone Number	
Create	Return
Create VoIP User-defined Profile	
SIP Setting	
Profile Name	<input type="text"/>
Registrar Address(or Hostname)	<input type="text"/>
Registrar Port	<input type="text" value="5060"/>
Expire	<input type="text" value="3600"/> seconds
User Domain/Realm	<input type="text"/> (If empty, it is the same as Registrar Address.)
Outbound Proxy Address	<input type="text"/> (If empty, it is the same as Registrar Address.)
Outbound Proxy Port	<input type="text" value="5060"/>
Phone Number	<input type="text"/>
Authentication Username	<input type="text"/>
Authentication Password	<input type="text"/>
Display Name	<input type="text"/>
<input type="button" value="Apply"/>	<input type="button" value="Cancel"/> Return

Profile Name: A user-defined name is for identifying the Profile.

Registrar Address(or Hostname): Indicate the VoIP SIP registrar IP address.

Registrar Port: Specify the port of the VoIP SIP registrar on which it will listen for register requests from VoIP device.

Expire: Expire time for the registration message sending.

User Domain/Realm: Set different domain name for the VoIP SIP proxy server.

Outbound Proxy Address: Indicate the VoIP SIP outbound proxy server IP address. This parameter is very useful when VoIP device is behind a NAT.

Outbound Proxy Port: Specify the port of the VoIP SIP outbound proxy on which it will listen for messages.

Phone Number: This parameter holds the registration ID of the user within the VoIP SIP registrar.

Authentication Username: Same as Phone Number.

Authentication Password: This parameter holds the password used for authentication within VoIP SIP registrar.

Confirm Password: Re-enter the password for confirmation.

Display Name: This parameter will be appeared on the Caller ID.

General Settings

This section reflects and contains basic settings for the VoIP module from selected provider in the Wizard section. Fail to provide correct information will halt making calls out to the Internet.

Outbound Proxy Address	<input type="text" value="sip.internode.on.net"/> (If empty, it is the same as Registrar Address.)
Outbound Proxy Port	<input type="text" value="5060"/>
Setting for Phone Port 2	<input type="button" value="Sync Now"/>
Registrar Address(or Hostname)	<input type="text"/>
Registrar Port	<input type="text" value="5060"/>
Expire	<input type="text" value="3600"/> seconds
User Domain/Realm	<input type="text"/> (If empty, it is the same as Registrar Address.)
Outbound Proxy Address	<input type="text"/> (If empty, it is the same as Registrar Address.)
Outbound Proxy Port	<input type="text" value="5060"/>
 <i>Please note: VoIP configuration changes will only take effect when you use apply changes and select Sync Now for the relevant line, or when you apply changes, save configuration and restart the device.</i>	
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

SIP Device Parameters

SIP: To use VoIP SIP as VoIP call signaling protocol. Default is set to **Disable**.

Silence Suppression (VAD): Voice Activation Detection (VAD) prevents transmitting the nature silence to consume the bandwidth. It is also known as Silence Suppression which is a software application that ensures the bandwidth is reserved only when voice activity is activated. Default is set to **Enable**.

Echo Cancellation: G.168 echo canceller is an ITU-T standard. It is used for isolating the echo while you are on the phone. This helps you not to hear much of your own voice reflecting on the phone while you talk. Default is set to **Enable**.

RTP Port: Provide the based value from the media (RTP) ports that are assigned for various endpoints and the different call sessions that may exist within an end-point. (Range from 5100 to 65535, default value is 5100)

Region: This selection is a drop-down box, which allows user to select the country for which the VoIP

device must work. When a country is selected, the country parameters are automatically loaded.

Voice QoS: Differentiated Services Code Point (DSCP), it is the first 6 bits in the ToS byte. DSCP Marking allows users to assign specific application traffic to be executed in priority by the next Router based on the DSCP value. See Table 4. The DSCP Mapping Table:

Note: To be sure the router(s) in the backbones network have the capability in executing and checking the DSCP through-out the QoS network.

Setting for Phone Port 1

Registrar Address(or Hostname): Indicate the VoIP SIP registrar IP address.

Registrar Port: Specify the port of the VoIP SIP registrar on which it will listen for register requests from VoIP device.

Expire: Expire time for the registration message sending.

User Domain/Realm: Set different domain name for the VoIP SIP proxy server.

Outbound Proxy Address: Indicate the VoIP SIP outbound proxy server IP address. This parameter is very useful when VoIP device is behind a NAT.

Outbound Proxy Port: Specify the port of the VoIP SIP outbound proxy on which it will listen for messages.

Setting for Phone Port 2

Please refer to descriptions in “Setting for Phone Port 1”.

How to register to SIP Server

- 1) In Wizard Section, select your VoIP Service Provider and input information in the filed of *Phone Number, Authentication Username* and *Authentication Password*.
- 2) In Wizard Section, click Apply button to apply the settings.
- 3) In General Settings, make sure general VoIP SIP information are correctly inserted.
- 4) In General Settings, click Apply button to apply the settings.
- 5) In General Settings, click Synch Now button to register the account(s) with your VoIP server.

Advanced – Parameters

VoIP Advanced Settings	
Parameters	
VoIP through IP Interface	ipwan 
Voice Frame Size	20 ms 
PSTN Auto-fallback	<input type="checkbox"/> Enable, when receive the specified SIP codes Edit 

VoIP through IP Interface: IP Interface decides where to send/receive the voip traffic; it includes: ipwan and iplan. Easy way to select the interface is to check the location of the SIP server. If it locates some where in the Internet then select **ipwan**. If the VoIP SIP server is on the local Network then select **iplan**.

Voice Frame Size: Frame size is available from 10ms to 60ms. Frame size meaning how many milliseconds the Voice packets will be queued and sent out. It is ideal to have the same frame size in both of Caller and Receiver.

PSTN Auto-fallback: Whenever VoIP SIP responses error and error code matching with the codes in the **Edit** section, the VoiP calls will automatically fallback to PSTN. In the other word, the call will be called via the PSTN when VoIP SIP returns an error code.

Click the **Edit** to add or remove the responses code. To be sure the code is separated by a comma(,).

For more information about SIP responses codes, please check [Here ▶](http://voip-info.org/wiki/view/sip+response+codes) to link to <http://voip-info.org/wiki/view/sip+response+codes> where you can get to know the meaning of each error code.

Advanced – PSTN Environment Adjustment

PSTN Environment Adjustment options will help you to adjust the onhook and offhook voltage detection values for your environment. You should use these if the default values are incorrect and result in PSTN calls not being detected properly, e.g. calls being terminated within 5 seconds of being answered. The actual levels are determined by your environment including the number and type of telephones used.

PSTN Environment Adjustment	
PSTN Voltage Configuration	ONHOOK Voltage: <input type="text" value="18"/> OFFHOOK Voltage: <input type="text" value="4"/> Hint ▶
Check your PSTN Voltage Levels	<input type="radio"/> Ensure your phone is ONHOOK, click <input type="button" value="Check Level"/> , value is .
	<input type="radio"/> Ensure your phone is OFFHOOK, click <input type="button" value="Check Level"/> , value is .
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> Return ▶	

Note: ONHOOK means hung up.

To take your phone OFFHOOK, lift the receiver then press Hook/Flash until you hear your normal PSTN dialtone, not your VoIP dialtone. Wait several seconds and then press Check Level.

You should check the OFFHOOK value for each telephone you have connected to this device. Set the OFFHOOK voltage to the lowest setting registered for all your telephones, e.g. if your telephones return values of 4, 5 and 7 then you should set your OFFHOOK voltage to 4.

Note: The detected values will not automatically be set by the Check Level function; you must enter the lowest level detected after testing all your telephones.

Phone Port

This section displays status and allows you to edit the account information of your Phones. Click **Edit** to update your phone information.

[Volume Control](#) ▶

Login Account Configuration

Phone Number: This parameter holds the registration ID of the user within the VoIP SIP registrar.

Authentication Username: Same as Phone Number.

Authentication Password: This parameter holds the password used for authentication within VoIP SIP registrar.

Confirm Password: Re-enter the password for confirmation.

Display Name: This parameter will be appeared on the Caller ID.

Codec Preference

Codec is known as Coder-Decoder used for data signal conversion. Set the priority of voice compression; Priority 1 owns the top priority.

G.729: It is used to encoder and decoder voice information into a single packet which reduces the bandwidth consumption. 8kbps bandwidth is needed.

G.711 μ -LAW: It is a basic non-compressed encoder and decoder technique. μ -LAW uses pulse code modulation (PCM) encoder and decoder to convert 14-bit linear sample. 64kbps bandwidth is needed.

G.711A-LAW: It is a basic non-compressed encoder and decoder technique. μ -LAW uses pulse code modulation (PCM) encoder and decoder to convert 13-bit linear sample. 64kbps bandwidth is needed.

Non-used: Only available in Priority 2 and 3. It is selected if codec is not to be used.

Note: Codec priority is assigned in the order as G.729 > G.711 μ -LAW > G.711A-LAW.

Speed Dial

Speed Dial comes handy to store frequently used telephone numbers which you can press number from 0 to 9 and the pound sign (#) on the phone keypad to activate the function. For example, speed dial to phone number lists on 9, just press keypad **9** then **#**. Your router will automatically call out to number listed on entry 9.

For examples:

If your friend Tim gives you a SIP URL as sip: 89755@192.246.69.223 then you can fill in as 89755@192.246.69.223.

If your friend Felix gives you a SIP URL as sip: felix@iptel.org then you can fill in as felix@iptel.org.

If your friend Greg gives you an IP address "192.246.56.56" only, then you can fill in as "192.246.56.56". In case, some of users may use DDNS, you can fill in with domain name as well.

Volume Control

Phone Port 1 - Volume Control	
Parameters	
Microphone	<input type="button" value="-"/>  <input type="button" value="+"/>
Speaker	<input type="button" value="-"/>  <input type="button" value="+"/>
Return 	

Volume control helps you to adjust the voice quality of telephone to the best comfortable listening level.

Press "-", the minus sign, to reduce either microphone or/both speaker's level of your telephone.

Press "+", the plus sign, to increase either microphone or/both speaker's level of your telephone.

PSTN Dial Plan

This section enables you to configure “VoIP with PSTN switching” on your system. You can define a range of dial plans to make regular call from VoIP switching to PSTN line. Prefix numbers is essential key to make a distinguishing between VoIP and Regular phone call. If actual numbers dialed matches with prefix number defined in this dial plan, the dialed number will be routed to the PSTN to make a regular call. Otherwise, the number will be routed to the VoIP networks.

Reminder! In order to utilize this feature, you must have registered and connected to your VoIP SIP Server first.

PSTN Dial Plan

Add Entry ▶

PSTN Dial Plan

Prefix	Number of Digits	Action		
000	0	dial_with_prefix	Edit ▶	Delete ▶
106	0	dial_with_prefix	Edit ▶	Delete ▶

Add PSTN Dial Plan Entry

Parameters

Prefix	<input type="text"/>
Number of Digits	<input type="text"/> (0..15)
Action	Dial with Prefix ▼
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> <input type="button" value="Return"/> ▶	

Prefix: Specify number(s) for switching to a PSTN call.

Number of Digits: Specify the total number of digits wish to dial out. Maximum digit number is 15.

Action: Specify a dialing method you wish to make PSTN call(s).

Ⓒ **Dial with Prefix:** The dialed number **with** prefix will be sent call through the PSTN.

NOTE: The actual dialed number of valid digits length requires matching in the Number of Digits filed.

Ⓒ **Dial without Prefix:** The dialed number will be sent call through the PSTN **without** prefix.

NOTE: The actual dialed number of valid digits length requires matching in the Number of Digits filed.

Ⓒ **Dial at Timeout:** The dialed number will be sent call through the PSTN **with** the prefix when timeout starts. This timeout activates when no more digits are dialed in a specific duration.

NOTE: The actual dialed number of valid digits length MUST NOT exceed in the Number of Digits filed.

Ⓒ **Dial at Timeout no Prefix:** The dialed number will be sent call through the PSTN **without** prefix when timeout starts. This timeout activates when no more digits are dialed in a specific duration.

NOTE: The actual dialed number of valid digits length MUST NOT exceed in the Number of Digits filed.

PSTN Dial Plan Examples:**1) Dial with Prefix**

Add Dial Plan Entry	
Parameters	
Prefix	<input type="text" value="01223"/>
Number of Digits	<input type="text" value="6"/> (0..15)
Action	<input type="text" value="Dial with Prefix"/> ▾
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> <input type="button" value="Return"/>	

If you dial 01223 707070, number 01223707070 will be dialed out via FXO to make a regular phone call.

2) Dial without Prefix

Add Dial Plan Entry	
Parameters	
Prefix	<input type="text" value="9"/>
Number of Digits	<input type="text" value="3"/> (0..15)
Action	<input type="text" value="Dial without Prefix"/> ▾
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> <input type="button" value="Return"/>	

If you dial 9102, the number 102 will only be dialed out via FXO port to make a regular phone call.

3) Dial at Timeout

Add Dial Plan Entry	
Parameters	
Prefix	<input type="text" value="01223"/>
Number of Digits	<input type="text" value="6"/> (0..15)
Action	<input type="text" value="Dial at Timeout"/> ▾
<input type="button" value="Apply"/> <input type="button" value="Cancel"/> <input type="button" value="Return"/>	

If you only dial 01223 7070 and no more numbers, after the timeout activates, 012237070 will be dialed to make a regular call via FXO port.

Even though 7070 (only 4 digits) does not match with number of digits 6 defined in the file, 7070 is still a valid phone number since it has not exceed 6 digits.

4) Dial at Timeout no Prefix

Add PSTN Dial Plan Entry

Parameters

Prefix	<input type="text" value="9"/>
Number of Digits	<input type="text" value="6"/> (0..15)
Action	<input type="text" value="Dial at Timeout no Prefix"/> ▼

[Return](#) 

If you only dial 97070 and no more numbers, after the timeout activates, 7070 will be dialed without prefix to make a regular call via FXO port.

Even though 7070 (only 4 digits) does not match with number of digits 6 defined in the file, 7070 is still a valid phone number since it has not exceed 6 digits

VoIP Dial Plan

This section helps you to make a telephony number dialed as making a regular call via VoIP. You no longer need to memorize a long dial string of number for making a VoIP call.

VoIP Dial Plan 1	
Parameters	
Special Digit Sequences	<input checked="" type="checkbox"/> *69 Return Call
	<input checked="" type="checkbox"/> *20 enable 'Don't Disturb' / *80 disable 'Don't Disturb'
	<input checked="" type="checkbox"/> *90x. Blind Call Transfer
	<input checked="" type="checkbox"/> x# Speed Dial (x: 2..9)
	<input checked="" type="checkbox"/> ## Redial
	<input checked="" type="checkbox"/> *74<x><number># Set the number of Speed Dial Code <x> (x: 2..9)
	<input type="checkbox"/> Phone number +#(pound key). Immediate Call Out Service
<input type="button" value="Apply"/> <input type="button" value="Test"/>	
Dial Plan Rules List	
Rule Name	
x.T	<input type="button" value="Delete"/>
<input type="button" value="Add"/>	

Parameters

A listed of special dial feature comes handy when you have a miss call or need to transfer a call to a third party. Details please refer to the section **Special dial codes** below.

***69 (Return Call):** Dial *69 to return the last missed call. It is only available for VoIP call(s).

***20 (Do not Disturb ON):** Dial *20 to set the No Disturb on. Your phone will not ring if someone calls.

***80 (Do not Disturb OFF):** Dial *80 to set the No Disturb off. Your will be able to hear ring tone when someone calls.

***90x (Blind Call Transfer):** Dial *90 + phone-number to translate a call to a third party. This feature is enabled by default.

x# Speed Dial (x:2..9): Refer to **Phone Port** section in the Web GUI. Set up your Speed Dial phone book first before accessing the Speed Dial feature. It is enabled by default.

Redial: Press ## to redial the latest number you dialed. This feature is enabled by default.

***74<x><number>#:** Use your phone key pad to insert a phone number to the Speed Dial phone book. Or you can update your Speed Dial phone number manually. Refer to the **Phone Port** section in the Web GUI for details.

Phone Number + #: This is the fast dial which you can dial out a phone number immediately without waiting.

Note: Refer to **Special Dial Code** section in this Manual for more details.

Test: It is a tool to help to identify the call number is being properly being processed prior to making an actual call.

Click **Apply** to apply the settings.

Dial Plan Rules List

Click **Add** to create and define VoIP dial-plan rule(s).

Create Rule	
Parameters	
Prefix Processing	<input type="radio"/> Prepend <input type="text"/> unconditionally
	<input type="radio"/> If prefix is <input type="text"/> , delete it
	<input type="radio"/> If prefix is <input type="text"/> , replace with <input type="text"/>
	<input checked="" type="radio"/> No prefix
Main Digit Sequence	<input type="text"/> @ <input type="text" value="Current Profile"/>
<input type="button" value="Apply"/> <input type="button" value="Return"/>	
<i>Digit Sequence Example:</i>	
x.	Any digit number between 0 and 9 in variable length. Maximum length is 16.
xxx	Any 3 digit number only between 0 and 9. Total length is 3. No period needed (.)
xxxx.	Any number between 0 and 9 with variable length but no shorter than 3 digits. Maximum Length is 16.
123x.	Any number (0-9) starting with 123. Maximum length is 16.
{124}x.	Any number (0-9) starting with 1 or 2 or 4. Maximum length is 16.
{1-3}x.	Any number(0-9) starting with number 1 to 3. Maximum length is 16.
9{4-6}8x.	Any number (0-9) starting with 9, the second number between 4-6, and third number 8. Maximum length is 16.

Prefix Processing:

Prepend xxx unconditionally: xxx number is appended unconditionally to the front of the dialing number when making a call. Prefix can also be included with any number and/or character such as +, *, #.

Note: For special service with +, *, #, you may need to check with your VoIP or Local Telephone Service Provider for information.

If Prefix is xxx, delete it: Prefix xxx is removed from the dialing numbers before making a call.

If Prefix is xxx, replace with: Prefix xxx is appended to the front of the dialing numbers when making a call.

No prefix: No prefix is appended to the front of the dialing numbers. It is set as in default settings.

Main Digit Sequence: The call(s) can be called out via SIP or PSTN or ENUM.

x: Any numeric number between 0 and 9.

. (**period**): Repeat numeric number(s) between 0 and 9.

***** (**asterisk sign**): It is normal character '*' on phone key pad. Please check if it is provided by your VoIP Service Provider or Local Telephone Service Provider for special service(s).

(**pound sign**): It is normal character '#' on phone key pad. Please check if it is provided by your VoIP Service Provider or Local Telephone Service Provider for special service(s).

<@ Current Profile>: Referring to the VoIP account registered on the *VoIP Wizard* for Port 1 / 2.

<@ PSTN>: Meaning making call(s) via the PSTN line.

<@ENUM>: Meaning making a VoIP SIP direct call via E.164 number ("ENUM") to an ENUM called. Electronic Number (ENUM) uses the DNS (Domain Network System) based technology to map between

a traditional phone number (PSTN) to an Internet addresses/ SIP URL. The ENUM number must be registered via a public ENUM site or your VoIP Service Provider.

<@ SIPgateway>: It is used for the *Intelligent Call Routing* feature where you need to set up your SIP account on the **VoIP User-defined Profiles** link on the VoIP Wizard page. Go to the *VoIP Wizard* in this manual for more information.

Dial-Plan Examples:	Description
x.	Any digit number between 0 and 9 in variable length. Maximum length is 16.
xxx	Any 3 digit number only between 0 and 9. Total length is 3. Note: No period is needed (.)
xxxx	Any number between 0 and 9 with variable length but no shorter than 3 digits. Maximum length is 16.
123x.	Any number (0-9) starting with 123. Maximum length is 16.
[x...x]x. For example: [124]x.	Any number (0-9) starting with 1 or 2 or 4. Maximum length is 16.
[x-x]x. For example: [1-3]x.	Any number (0-9) starting with number 1 to 3. Maximum length is 16.
x[x-x]x. For example: 9[4-6]8x.	Any number (0-9) starting with 9, the second number between 4-6, and third number 8. Maximum length is 16.
Special Dial Plan Examples:	Description
*xx*x.	Starting with '*' sign' + any two digit numbers + any number (0-9) in variable length. Maximum length is 16.
xx	Starting with '' sign' + any 2 digit numbers between 0 and 9. Total length including the * is 3. Note: No period is needed (.)
xx*x.	Starting with ' sign' + any two digit numbers between 0 + any number (0-9) in variable length. Maximum length is 16.
#xx.	Starting with '# sign' + any digit number (0-9) in variable length. Maximum length is 16.
##xx*x.	Starting with '## sign' + any two digit numbers + '* sign' + any number (0-9) in variable length. Maximum length is 16.

<@SIPgateway> / Intelligent Call Routing Example:

VoIP Gateway let you use 3 VoIP/SIP providers at the same time. VoIP/SIP providers are *localcheap.com*, *longdischeap.com* and *mobilecheap.com*. Each provider has its price for different type of calls and I can set the following rule for each providers.

- 1) Phone 1: For Local calls: I use *localcheap.com* that charges \$0.01 per minute to all local calls. I set a dial rule, **<:03>[123]x.T**, on my phone port 1.

Create Rule**Parameters**

Prefix Processing	<input checked="" type="radio"/> Prepend <input type="text" value="03"/> unconditionally
	<input type="radio"/> If prefix is <input type="text"/> , delete it
	<input type="radio"/> If prefix is <input type="text"/> , replace with <input type="text"/>
	<input type="radio"/> No prefix
Main Digit Sequence	<input type="text" value="[123]x."/> @ <input type="text" value="Current Profile"/>
<input type="button" value="Apply"/> <input type="button" value="Return"/>	

Localcheap.com is the default VoIP provider I set on phone port 1. When I call out any number start with 1 or 2 or 3 and plus rest of the phone number for local call, 03 is always prepended in front of these number. If 23295 are dialed, 03-2-32935 is the actual phone number called out via localcheap.com provider.

- 2) Phone 1: For International calls: I use *longdischeap.com* that charges \$0.05 per minute to all International long distance calls. I set a dial rule, **0[2456]x.T<@LongdisCheap>**, on my phone port 1.

Create Rule**Parameters**

Prefix Processing	<input type="radio"/> Prepend <input type="text"/> unconditionally
	<input type="radio"/> If prefix is <input type="text"/> , delete it
	<input type="radio"/> If prefix is <input type="text"/> , replace with <input type="text"/>
	<input checked="" type="radio"/> No prefix
Main Digit Sequence	<input type="text" value="0[2456]x."/> @ <input type="text" value="LongdisCheap"/>
<input type="button" value="Apply"/> <input type="button" value="Return"/>	

Longischeap.com is one of the VoIP providers I set in the User-defined profile. No prefix is attached to the dialed number when I call out number 0 plus any following number 2 or 4 or 5 or 6 and plus rest of the phone number for an international call. If **02016148513295** are dialed, 0-2-016148513295 is the actual phone number called out via longdischeap.com provider.

- 3) Phone 2: For Mobile calls: I use *mobilecheap.com* that charges \$0.25 per minute to all local calls. I set a dial rule, **<123:09>39x.T**, on my phone port 2.

Create Rule**Parameters**

Prefix Processing	<input type="radio"/> Prepend <input type="text"/> unconditionally
	<input type="radio"/> If prefix is <input type="text"/> , delete it
	<input checked="" type="radio"/> If prefix is <input type="text" value="123"/> , replace with <input type="text" value="09"/>
	<input type="radio"/> No prefix
Main Digit Sequence	<input type="text" value="39x."/> @ <input type="text" value="Current Profile"/>
<input type="button" value="Apply"/> <input type="button" value="Return"/>	

Mobilecheap.com is the default VoIP provider I set on phone port 2. When I call out 123-39-45678 for a mobile call, 123 is replaced with 09. Therefore, 09-39-45678 is the actual phone number called out via Mobilecheap.com provider.

The Intelligent Call Gateway not only saves time from changing VoIP settings to different provider to make call get routed to specific gateway(s) automatically but also taking advantage of different call rate.

Ring & Tone

This section allows advanced user to change the existing or newly defined parameters for the various ring tones (dial tone, busy tone, answer tone and etc.)

Ring & Tone Configuration							
Country Specific Ring & Tone							
Region	UK <input type="button" value="v"/>						
Ring Parameters							
	On 1	Off 1	On 2	Off 2	On 3	Off 3	
Ring Cadence (in ms)	400	200	400	2000	0	0	
Tone Parameters							

Country Specific Ring & Tone

Region: Select a country ring-tone, from the drop-down list, where you are located. This VoIP router provides default parameter of ring tones according to different countries. The ring-tone parameters are automatically displayed after entering a specific country. If your country is not in the list, you may manually create ring-tone parameters.

Ring Parameters

Ring Cadence (in ms): Ring cadence is defined by three fields, Frequency: On Time1, Off Time1, On Time2, Off Time2 and On Time3, Off Time3. Frequency is specified in Hertz. Time is given in milliseconds.

Tone Parameters

You may need to check with your local telephone service provider for such information. Also, it is recommended that this option be configured by an advanced user, unless you are instructed to do so.

Click **Apply** to apply the settings.

Special Dial Codes

The following table lists the special dial codes that are built-in to the system:

Option	Description
Flash-hook (Wireless Router with LINE port only)	Switch to PSTN line Note: A quick press of the hook. On some phones a button is provided which provides Flash-hook functionality. The button is marked "FLASH" or "RECALL".
*69	Return the last missed call for SIP service only Note: Entering this on a phone will call the last number which made a call to the phone. For example A makes a call to B, but hangs up before B answers. If B enters *69, A will be called.
##	Last number redial
*20	Set do not disturb on Note: It is possible to set a Do-Not-Disturb feature on a phone such that any phone which calls the phone will receive an engaged tone and the phone called will not ring. For example, B enters *20 and hangs up. A makes a call to B, and receives the engaged tone and phone B does not ring.
*80	Set do not disturb off
*74<x><number>#	Set the number for Speed dial code 'x', where 'x' is a number between 2 and 9. Note: Where <x> is a number between 2 and 9, and <number> is the number to dial. The code needed to dial a speed dial from a phone connected to a VoIP Router is: <x>#, where <x> is a number between 2 and 9. The settings will infect to your setting in Speed Dial on WEB GUI.
*90<phone-number>	Set the number for performing Blind Call Transfer , where <phone-number> is the number that you wish to transfer the call to. It's for SIP service only. Note: In Blind Call Transfer , you have a call in progress (incoming or outgoing) and decide you wish to transfer the call to another phone. To transfer the call, perform the following steps: 1. Hook-flash to get a dial tone. 2. Dial *90<phone-number> (e.g. *907401), there will be a confirmation tone then hang up. The other end will hear ring back and the called third-party phone will ring. When the third-party phone is picked up the two calls will be connected. If the third-party phone does not answer then the caller being transferred can hang up to cancel the connect attempt.

QoS (Quality of Service)

QoS function helps you to control your network traffic for each application from LAN (Ethernet and/or Wireless) to WAN (Internet). It facilitates you to control the different quality and speed of through put for each application when the system is running with full loading of upstream.

Here are items within the **QoS** section: **Prioritization** and **Outbound / Inbound IP Throttling** (bandwidth management).

Prioritization

There are three priority settings to be provided in the Router:

- Ⓐ **High**
- Ⓑ **Normal** (The default is normal priority for all of traffic without setting)
- Ⓒ **Low**

And the balances of utilization for each priority are High (60%), Normal (30%) and Low (10%).

Prioritization							
Configuration (from LAN to WAN packet)							
Application	Time Schedule	Priority	Protocol	Source Port	Source IP Address Range ('0.0.0.0' means Any)		DSCP Marking

Click Clear

You can click **Clear** to delete the existing Application.

Application: A user-define description to identify this new policy/application.

Time Schedule: Scheduling your prioritization policy.

Priority: The priority given to each policy/application. Its default setting is set to High; you may adjust this setting to fit your policy/application.

Protocol: The name of supported protocol.

Source Port: The source port of packets to be monitored.

Destination Port: The destination port of packets to be monitored.

Source IP Address Range: The source IP address or range of packets to be monitored.

Destination IP address Range: The destination IP address or range of packets to be monitored.

DSCP Marking: Differentiated Services Code Point (DSCP), it is the first 6 bits in the ToS byte. DSCP Marking allows users to assign specific application traffic to be executed in priority by the next Router based on the DSCP value. See Table 4. The DSCP Mapping Table:

Note: To be sure the router(s) in the backbones network have the capability in executing and checking the DSCP through-out the QoS network.

Table 4: DSCP Mapping Table

DSCP Mapping Table	
(Wireless) Router Device	Standard DSCP
Disabled	None
Best Effort	Best Effort (000000)
Premium	Express Forwarding (101110)
Gold service (L)	Class 1, Gold (001010)

Example: QoS for your Network

Connection Diagram

Information and Settings

Upstream: 928 kbps
Downstream: 8 Mbps

VoIP User : 192.168.1.1
Normal Users : 192.168.1.2~192.168.1.5
Restricted User: 192.168.1.100

Prioritization

Configuration (from LAN to WAN packet)

Application	Time Schedule	Priority	Protocol	Source Port	Source IP Address Range ('0.0.0.0' means Any)	DSCP Marking
				Destination Port	Destination IP Address Range ('0.0.0.0' means Any)	
PPTP	Always On	High	GRE	none	0.0.0.0 ~ 0.0.0.0	Gold service (L)
VoIP	Always On	High	any	0 ~ 0	192.168.1.1 ~ 192.168.1.1	Gold service (L)
Restricted	TimeSlot1	Low	any	0 ~ 0	192.168.1.100 ~ 192.168.1.100	Gold service (L)
				0 ~ 0	0.0.0.0 ~ 0.0.0.0	

Mission-critical application

Mostly the VPN connection is mission-critical application for doing data exchange between head and branch office.

PPTP	Always On	High	GRE	none	0.0.0.0	~	0.0.0.0	Gold service (L)
				none	0.0.0.0	~	0.0.0.0	

The mission-critical application must be sent out smoothly without any dropping. Set priority as high level for preventing any other applications to saturate the bandwidth.

Voice application

Voice is latency-sensitive application. Most VoIP devices are use SIP protocol and the port number will be assigned by SIP module automatically. Better to use fixed IP address for catching VoIP packets as high priority.

VoIP	Always On	High	any	0	~	0	192.168.1.1	~	192.168.1.1	Gold service (L)
				0	~	0	0.0.0.0	~	0.0.0.0	

Above settings will help to improve quality of your VoIP service when traffic is full loading.

Restricted Application

Some of companies will setup FTP server for customer downloading or home user sharing their files by using FTP.

Restricted	TimeSlot1	Low	any	0	~	0	192.168.1.100	~	192.168.1.100	Gold service (L)
				0	~	0	0.0.0.0	~	0.0.0.0	

With above settings that help to limit utilization of upstream of FTP. Time schedule also help you to only limit utilization at daytime.

Advanced setting by using IP throttling

With IP throttling you can specify more detail for allocating bandwidth; even the applications are located in the same level.

Upstream: 928kbps (29*32kbps)

Mission-critical Application: 192kbps (6*32kbps)

Voice Application: 128kbps (4*32kbps)

Restricted Application: 160kbps (5*32kbps)

Other Applications: 448kbps (14*32kbps)

$6+4+14+5=29$, $29*32\text{kbps}=928\text{kbps}$

Outbound IP Throttling**Configuration (from LAN to WAN packet)**

Application	Time Schedule	Protocol	Source Port	Source IP Address Range (‘0.0.0.0’ means Any)	Rate Limit
			Destination Port	Destination IP Address Range (‘0.0.0.0’ means Any)	
PPTP	Always On ▼	gre ▼	0 ~ 0	0.0.0.0 ~ 0.0.0.0	6 *32 (kbps)
			0 ~ 0	0.0.0.0 ~ 0.0.0.0	
VoIP	Always On ▼	any ▼	0 ~ 0	0.0.0.0 ~ 0.0.0.0	4 *32 (kbps)
			0 ~ 0	0.0.0.0 ~ 0.0.0.0	
Restricted	TimeSlot1 ▼	any ▼	0 ~ 0	192.168.1.100 ~ 192.168.1.100	5 *32 (kbps)
			0 ~ 0	0.0.0.0 ~ 0.0.0.0	
Others	TimeSlot1 ▼	any ▼	0 ~ 0	192.168.1.2 ~ 192.168.1.5	14 *32 (kbps)
			0 ~ 0	0.0.0.0 ~ 0.0.0.0	

Sometime your customers or friends may upload their files to your FTP server and that will saturate your downstream bandwidth. The settings below help you to limit bandwidth for the restricted application.

Inbound IP Throttling**Configuration (from WAN to LAN packet)**

Application	Time Schedule	Protocol	Source Port	Source IP Address Range (‘0.0.0.0’ means Any)	Rate Limit
			Destination Port	Destination IP Address Range (‘0.0.0.0’ means Any)	
Restricted	TimeSlot1 ▼	any ▼	0 ~ 0	0.0.0.0 ~ 0.0.0.0	64 *32 (kbps)
			0 ~ 0	192.168.1.100 ~ 192.168.1.100	

Virtual Server (“Port Forwarding”)

In TCP/IP and UDP networks a port is a 16-bit number used to identify which application program (usually a server) incoming connections should be delivered to. Some ports have numbers that are pre-assigned to them by the IANA (the Internet Assigned Numbers Authority), and these are referred to as “well-known ports”. Servers follow the well-known port assignments so clients can locate them.

If you wish to run a server on your network that can be accessed from the WAN (i.e. from other machines on the Internet that are outside your local network), or any application that can accept incoming connections (e.g. Peer-to-peer/P2P software such as instant messaging applications and P2P file-sharing applications) and are using NAT (Network Address Translation), then you will usually need to configure your router to forward these incoming connection attempts using specific ports to the PC on your network running the application. You will also need to use port forwarding if you want to host an online game server.

The reason for this is that when using NAT, your publicly accessible IP address will be used by and point to your router, which then needs to deliver all traffic to the private IP addresses used by your PCs. Please see the **WAN** configuration section of this manual for more information on NAT.

The device can be configured as a virtual server so that remote users accessing services such as Web or FTP services via the public (WAN) IP address can be automatically redirected to local servers in the LAN network. Depending on the requested service (TCP/UDP port number), the device redirects the external service request to the appropriate server within the LAN network

Virtual Server Table

Application	Time Schedule	Protocol	External Port	Redirect Port	IP Address		
-------------	---------------	----------	---------------	---------------	------------	--	--

Add Virtual Server

Because NAT can act as a “natural” Internet firewall, your router protects your network from being accessed by outside users when using NAT, as all incoming connection attempts will point to your router unless you specifically create Virtual Server entries to forward those ports to a PC on your network.

When your router needs to allow outside users to access internal servers, e.g. a web server, FTP server, Email server or game server, the router can act as a “virtual server”. You can set up a local server with a specific port number for the service to use, e.g. web/HTTP (port 80), FTP (port 21), Telnet (port 23), SMTP (port 25), or POP3 (port 110), When an incoming access request to the router for a specified port is received, it will be forwarded to the corresponding internal server.

Add Virtual Server in 'ipwan' IP Interface

Virtual Server Entry

Time Schedule	Always On ▼
Application Helper ▶	<input type="text"/>
Protocol	tcp ▼
External Port	from <input type="text" value="0"/> to <input type="text" value="0"/>
Redirect Port	from <input type="text" value="0"/> to <input type="text" value="0"/>
Internal IP Address Candidates ▶	<input type="text"/>

 [Return ▶](#)

Time Schedule: A self-defined time period to enable your virtual server. You may specify a time schedule or Always on for the usage of this Virtual Server Entry. For setup and detail, refer to **Time Schedule** section

Application: Users-define description to identify this entry or click [Helper ▶](#) to select existing predefined rules.

[Helper ▶](#): 20 predefined rules are available. Click the Radio button to select the rule; Application, Protocol and External/Redirect Ports will be filled after the selection.

Protocol: It is the supported protocol for the virtual server. In addition to specifying the port number to be used, you will also need to specify the protocol used. The protocol used is determined by the particular application. Most applications will use TCP or UDP.

External Port: The Port number on the Remote/WAN side used when accessing the virtual server.

Redirect Port: The Port number used by the Local server in the LAN network.

Internal IP Address: The private IP in the LAN network, which will be providing the virtual server application. [Candidates ▶](#) List all existing PCs connecting to the network. You may assign a PC with IP address and MAC from this list.

Example:

If you like to remote accessing your Router through the Web/HTTP at all time, you would need to enable port number 80 (Web/HTTP) and map to Router's IP Address. Then all incoming HTTP requests from you (Remote side) will be forwarded to the Router with IP address of 192.168.1.254. Since port number 80 has already been predefined, next to the **Application** click **Helper**. A list of predefined rules window will pop and select **HTTP_Server**.

Application: *HTTP_Server*
 Time Schedule: *Always On*
 Protocol: *tcp*
 External Port: *80-80*
 Redirect Port: *80-80*
 IP Address: *192.168.1.254*

Application	Time Schedule	Protocol	External Port	Redirect Port	IP Address		
HTTP_Server	Always On	tcp	80 - 80	80 - 80	192.168.1.254	Edit ▶	Delete ▶

Edit: Click it to edit this virtual server application.

Delete: Click it to delete this virtual server application.

Using port forwarding does have security implications, as outside users will be able to connect to PCs on your network. For this reason you are advised to use specific Virtual Server entries just for the ports your application requires, instead of using DMZ. As doing so will result in all connections from the WAN attempt to access to your public IP of the DMZ PC specified.

**Attention**

If you have disabled the NAT option in the WAN-ISP section, the Virtual Server function will hence be invalid.

If the DHCP server option is enabled, you have to be very careful in assigning the IP addresses of the virtual servers in order to avoid conflicts. The easiest way of configuring Virtual Servers is to manually assign static IP address to each virtual server PC, with an address that does not fall into the range of IP addresses that are to be issued by the DHCP server. You can configure the virtual server IP address manually, but it must still be in the same subnet as the router.

Edit DMZ Host

The DMZ Host is a local computer exposed to the Internet. When setting a particular internal IP address as the DMZ Host, all incoming packets will be checked by the Firewall and NAT algorithms then passed to the DMZ host, when a packet received does not use a port number used by any other Virtual Server entries.

Cautious: This Local computer exposing to the Internet may face varies of security risks.

Time Schedule: A self-defined time period to enable your virtual server. You may specify a time schedule or Always on for the usage of this Virtual Server Entry. For setup and detail, refer to **Time Schedule** section

Application: Users-defined description to identify this entry or click [Helper ▶](#) to select existing predefined rules.

[Helper ▶](#): 20 predefined rules are available. Click the Radio button to select the rule; Application, Protocol and External/Redirect Ports will be filled after the selection.

Protocol: It is the supported protocol for the virtual server. In addition to specifying the port number to be used, you will also need to specify the protocol used. The protocol used is determined by the particular application. Most applications will use TCP or UDP;

Global IP: Define a public/ WAN IP address for this Application to use. This Global IP address must be defined in the **Global IP Address**.

External Port: The Port number on the Remote/WAN side used when accessing the virtual server.

Redirect Port: The Port number used by the Local server in the LAN network.

Internal IP Address: The private IP in the LAN network, which will be providing the virtual server application. [Candidates ▶](#) List all the connecting PCs on the network. You may assign specific PC with its IP address and MAC from the list.

Select the **Apply** button to apply your changes.

Example: List of some well-known and registered port numbers.

The Internet Assigned Numbers Authority (IANA) is the central coordinator for the assignment of unique parameter values for Internet protocols. Port numbers range from 0 to 65535, but only ports numbers 0 to 1023 are reserved for privileged services and are designated as “well-known ports” (Please refer to Table 5). The registered ports are numbered from 1024 through 49151. The remaining ports, referred to as dynamic or private ports, are numbered from 49152 through 65535.

For further information, please see IANA's website at: <http://www.iana.org/assignments/port-numbers>

For help on determining which private port numbers are used by common applications on this list, please see the FAQs (Frequently Asked Questions) at: <http://www.billion.com>

Table 5: Well-known and registered Ports

Port Number	Protocol	Description
20	TCP	FTP Data
21	TCP	FTP Control
22	TCP & UDP	SSH Remote Login Protocol
23	TCP	Telnet
25	TCP	SMTP (Simple Mail Transfer Protocol)
53	TCP & UDP	DNS (Domain Name Server)
69	UDP	TFTP (Trivial File Transfer Protocol)
80	TCP	World Wide Web HTTP
110	TCP	POP3 (Post Office Protocol Version 3)
119	TCP	NEWS(Network News Transfer Protocol)
123	UDP	NTP (Network Time Protocol) / SNTP (Simple Network Time Protocol)
161	TCP	SNMP
443	TCP & UDP	HTTPS
1503	TCP	T.120
1720	TCP	H.323
4000	TCP	ICQ
7070	UDP	RealAudio

Time Schedule

The Time Schedule supports up to 16 time slots which helps you to manage your Internet connection. In each time profile, you may schedule specific day(s) i.e. Monday through Sunday to restrict or allowing the usage of the Internet by users or applications.

This Time Schedule correlates closely with router's time, since router does not have a real time clock on board; it uses the Simple Network Time Protocol (SNTP) to get the current time from an SNTP server from the Internet. Refer to **Time Zone** for details. Your router time should correspond with your local time. If the time is not set correctly, your Time Schedule will not function properly.

Time Schedule						
Time Slot						
ID	Name	Day in a week	Start Time	End Time		
1	TimeSlot1	sMTWTFs	08 : 00	18 : 00	Edit	Clear
2	TimeSlot2	sMTWTFs	08 : 00	18 : 00	Edit	Clear
3	TimeSlot3	sMTWTFs	08 : 00	18 : 00	Edit	Clear

ID: This is the index of the time slot.

Name: A user-define description to identify this time portfolio.

Day: The default is set from Monday through Friday. You may specify the days for the schedule to be applied.

Start Time: The default is set at 8:00 AM. You may specify the start time of the schedule.

End Time: The default is set at 18:00 (6:00PM). You may specify the end time of the schedule.

Select the **Apply** button to apply your changes.

Delete a Time Slot

Click **Clear** to delete the existing Time profile, i.e. erase the Day and back to default setting of Start Time / End Time.

Advanced

Configuration options within the **Advanced** section are for users who wish to take advantage of the more advanced features of the router. Users who do not understand the features should not attempt to reconfigure their router, unless advised to do so by support staff.

Here are items within the **Advanced** section: [Static Route](#), [Dynamic DNS](#), [Check Email](#), [Device Management](#) and [IGMP](#).

Static Route

Click on **Routing Table** and then choose **Create Route** add a routing table.

Static Route			
Create			
Destination	<input type="text"/>		
Netmask	<input type="text"/>		
via Gateway	<input type="text"/>	or Interface	<input type="text" value=""/>
Cost	<input type="text" value="1"/>		
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>			

Destination: This is the destination subnet IP address.

Netmask: Subnet mask of the destination IP addresses based on above destination subnet IP.

Gateway: This is the gateway IP address to which packets are to be forwarded.

Interface: Select the interface through which packets are to be forwarded.

Cost: This is the same meaning as Hop. This should usually be left at 1.

Dynamic DNS

The Dynamic DNS function allows you to alias a dynamic IP address to a static hostname, allowing users whose ISP does not assign them a static IP address to use a domain name. This is especially useful for hosting servers via your ADSL connection, so that anyone wishing to connect to you may use your domain name, rather than having to use your dynamic IP address, which changes from time to time. This dynamic IP address is the WAN IP address of the router, which is assigned to you by your ISP.

Dynamic DNS	
Parameters	
Dynamic DNS	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Dynamic DNS Server	www.dyndns.org (dynamic) ▾
Wildcard	<input type="checkbox"/> Enable
Domain Name	<input type="text"/>
Username	<input type="text"/>
Password	<input type="text"/>
Period	25 <input type="text"/> Day(s) ▾
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

You will first need to register and establish an account with the Dynamic DNS provider using their website, for example <http://www.dyndns.org/>

There are more than 5 DDNS services supported.

☉ Disable: Check to disable the Dynamic DNS function.

☉ Enable: Check to enable the Dynamic DNS function. The following fields will be activated and required:

Dynamic DNS Server: Select the DDNS service you have established an account with.

Domain Name, Username and Password: Enter your registered domain name and your username and password for this service.

Period: Set the time period between updates, for the Router to exchange information with the DDNS server. In addition to updating periodically as per your settings, the router will perform an update when your dynamic IP address changes.

Check Email

This function allows you to have the router check your POP3 mailbox for new Email messages. The Mail LED on your router will light when it detects new messages waiting for download. You may also view the status of this function using the Status – Email Checking section of the web interface, which also provides details on the number of new messages waiting. See the Status section of this manual for more information.

Check Email	
Parameters	
Check Email	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
Account Name	<input type="text"/>
Password	<input type="text"/>
POP3 Mail Server	<input type="text"/>
Period	<input type="text" value="60"/> minutes
Dial-out for Checking Emails	<input type="checkbox"/> Automatic
<input type="button" value="Apply"/>	

Disable: Check to disable the router's Email checking function.

Enable: Check to enable the routers Email checking function. The following fields will be activated and required:

Account Name: Enter the name (login) of the POP3 account you wish to check. Normally, it is the text in your email address before the "@" symbol. If you have trouble with it, please contact your ISP.

Password: Enter the account's password.

POP3 Mail Server: Enter your (POP) mail server name. Your Internet Service Provider (ISP) or network administrator will be able to supply you with this.

Period: Enter the value in minutes between periodic mail checks.

Automatically dial-out for checking emails: When the function is enabled, your router will connect to your ISP automatically to check emails if your Internet connection dropped. Please be careful when using this feature if your ADSL service is charged by time online.

Device Management

The Device Management advanced configuration settings allow you to control your router's security options and device monitoring features.

Device Management			
Device Host Name			
Host Name	<input type="text" value="home.gateway"/>		
Embedded Web Server			
* HTTP Port	<input type="text" value="80"/>	(80 is default HTTP port)	
Management IP Address	<input type="text" value="0.0.0.0"/>	(0.0.0.0' means Any)	
Management IP Netmask	<input type="text" value="255.255.255.255"/>		
Management IP Address(2)	<input type="text" value="0.0.0.0"/>		
Management IP Netmask(2)	<input type="text" value="255.255.255.255"/>		
Expire to auto-logout	<input type="text" value="180"/>	seconds	
Universal Plug and Play (UPnP)			
UPnP	<input type="radio"/> Enable <input checked="" type="radio"/> Disable		
* UPnP Port	<input type="text" value="2800"/>		
SNMP Access Control			
SNMP V1 and V2			
Read Community	<input type="text" value="public"/>	IP Address	<input type="text" value="0.0.0.0"/>
Write Community	<input type="text" value="password"/>	IP Address	<input type="text" value="0.0.0.0"/>
Trap Community	<input type="text"/>	IP Address	<input type="text"/>
SNMP V3			
Username	<input type="text"/>	Password	<input type="text"/>
Access Right	<input checked="" type="radio"/> Read <input type="radio"/> Read/Write		IP Address <input type="text"/>
* : This setting will become effective after you save to flash and restart the router.			
<input type="button" value="Apply"/>			

Embedded Web Server (2 Management IP accounts)

HTTP Port: This is the port number the router's embedded web server (for web-based configuration) will use. The default value is the standard HTTP port, 80. Users may specify an alternative if, for example, they are running a web server on a PC within their LAN.

Management IP Address: You may specify an IP address allowed to logon and access the router's web server. Setting the IP address to 0.0.0.0 will disable IP address restrictions, allowing users to login from any IP address.

Expire to auto-logout: Specify a time frame for the system to auto-logout the user's configuration session.

For Example: User A changes HTTP port number to **100**, specifies their own IP address of **192.168.1.55**, and sets the logout time to be **100** seconds. The router will only allow User A access from the IP address **192.168.1.55** to logon to the Web GUI by typing: <http://192.168.1.254:100> in their web browser.

After 100 seconds, the device will automatically logout User A.

Universal Plug and Play (UPnP)

UPnP offers peer-to-peer network connectivity for PCs and other network devices, along with control and data transfer between devices. UPnP offers many advantages for users running NAT routers through UPnP NAT Traversal, and on supported systems makes tasks such as port forwarding much easier by letting the application control the required settings, removing the need for the user to control advanced configuration of their device.

Both the user's Operating System and the relevant application must support UPnP in addition to the router. Windows XP and Windows Me natively support UPnP (when the component is installed), and Windows 98 users may install the Internet Connection Sharing client from Windows XP in order to support UPnP. Windows 2000 does not support UPnP.

Disable: Check to disable the router's UPnP functionality.

Enable: Check to enable the router's UPnP functionality.

UPnP Port: Its default setting is 2800. It is highly recommended for users to use this port value. If this value conflicts with other ports already being used you may wish to change the port.

SNMP Access Control (Software on a PC within the LAN is required in order to utilize this function) – Simple Network Management Protocol.

SNMP V1 and V2:

Read Community: Specify a name to be identified as the Read Community, and an IP address. This community string will be checked against the string entered in the configuration file. Once the string name is matched, user obtains this IP address will be able to view the data.

Write Community: Specify a name to be identified as the Write Community, and an IP address. This community string will be checked against the string entered in the configuration file. Once the string name is matched, users from this IP address will be able to view and modify the data.

Trap Community: Specify a name to be identified as the Trap Community, and an IP address. This community string will be checked against the string entered in the configuration file. Once the string name is matched, users from this IP address will be sent SNMP Traps.

SNMP V3:

Specify a name and password for authentication. And define the access right from identified IP address. Once the authentication has succeeded, users from this IP address will be able to view and modify the data.

SNMP Version: SNMPv2c and SNMPv3

SNMPv2c is the combination of the enhanced protocol features of SNMPv2 without the SNMPv2 security. The "c" comes from the fact that SNMPv2c uses the SNMPv1 community string paradigm for "security", but is widely accepted as the SNMPv2 standard.

SNMPv3 is a strong authentication mechanism, authorization with fine granularity for remote monitoring.

Traps supported: Cold Start, Authentication Failure.

The following MIBs are supported:

From RFC 1213 (MIB-II):

- System group
- Interfaces group
- Address Translation group

- IP group
- ICMP group
- TCP group
- UDP group
- EGP (not applicable)
- Transmission
- SNMP group

From RFC1650 (EtherLike-MIB):

- dot3Stats

From RFC 1493 (Bridge MIB):

- dot1dBase group
- dot1dTp group
- dot1dStp group (if configured as spanning tree)

From RFC 1471 (PPP/LCP MIB):

- pppLink group
- pppLqr group (not applicable)

From RFC 1472 (PPP/Security MIB):

- PPP Security Group)

From RFC 1473 (PPP/IP MIB):

- PPP IP Group

From RFC 1474 (PPP/Bridge MIB):

- PPP Bridge Group

From RFC1573 (IfMIB):

- ifMIBObjects Group

From RFC1695 (atmMIB):

- atmMIBObjects

From RFC 1907 (SNMPv2):

- only snmpSetSerialNo OID

IGMP

IGMP, known as *Internet Group Management Protocol*, is used to management hosts from multicast group.

IGMP	
Parameters	
IGMP Forwarding	<input checked="" type="radio"/> Enable <input type="radio"/> Disable
IGMP Snooping	<input type="radio"/> Enable <input checked="" type="radio"/> Disable
<input type="button" value="Apply"/>	

IGMP Forwarding: Accepting multicast packet. Default is set to **Enable**.

IGMP Snooping: Allowing switched Ethernet to check and make correct forwarding decisions. Default is set to **Disable**

Save Configuration to Flash

After changing the router's configuration settings, you must save all of the configuration parameters to FLASH to avoid them being lost after turning off or resetting your router. Click **Save** to write your new configuration to FLASH.

Save Config to FLASH
Please confirm that you wish to save the configuration.
<i>There will be a delay while saving as configuration information is written to FLASH chips.</i>
<input type="button" value="Apply"/>

Logout

To exit the router's web interface, choose **Logout**. Please ensure that you have saved the configuration settings before you logout.

Be aware that the router is restricted to only one PC accessing the configuration web pages at a time. Once a PC has logged into the web interface, other PCs cannot get access until the current PC has logged out of the web interface. If the previous PC forgets to logout, the second PC can access the page after a user-defined period, by default 3 minutes. You can modify this value using the **Advanced – Device Management** section of the web interface. Please see the **Advanced** section of this manual for more information.

Chapter 5: Troubleshooting

If the router is not functioning properly, first check this chapter for simple troubleshooting before contacting your service provider or Billion support.

Problems starting up the router

<i>Problem</i>	<i>Corrective Action</i>
None of the LEDs are on when you turn on the router.	Check the connection between the adapter and the router. If the error persists, you may have a hardware problem. In this case you should contact technical support.
You have forgotten your router login and/or password.	Try the default login and password, refer to Chapter 3. If this fails, you can restore your router to its factory settings by holding the Reset button on the back of your router more than 6 seconds.

Problems with the LAN Interface

<i>Problem</i>	<i>Corrective Action</i>
Can't ping any PCs on the LAN.	Check the Ethernet LEDs on the front panel. The LED should be on for a port that has a PC connected. If it is off, check the cables between your router and the PC. Make sure you have uninstalled any software firewall for troubleshooting.
	Verify that the IP address and the subnet mask are consistent between the router and the workstations.

APPENDIX A: Product Support and Contact Information

Most problems can be solved by referring to the **Troubleshooting** section in the User's Manual. If you cannot resolve the problem with the **Troubleshooting** chapter, please contact the dealer where you purchased this product.
